<p><b>Reference:</b> Park et al. (2005)</p> <p><b>Period of Study:</b> November 2000–October 2003</p> <p><b>Location:</b> Greater Boston area, MA</p>	<p><b>Outcome:</b> Change in HRV (SDNN, HF, LF, LFHFR)</p> <p><b>Mean age:</b> 72.7 years</p> <p><b>Study Design:</b> Cross-sectional</p> <p><b>N:</b> 497 adult males living in the Greater Boston, MA area</p>	<p><b>Pollutant:</b> PM<sub>2.5</sub></p> <p><b>Averaging Time:</b> 4 h 24 h 48 h</p> <p><b>Mean (SD):</b> 11.4 (8.0)</p> <p><b>Range:</b> 6.45–62.9</p> <p><b>Copollutant:</b> O<sub>3</sub>, Particle number count, BC, NO<sub>2</sub>, SO<sub>2</sub>, CO</p>	<p><b>PM Increment:</b> 8 µg/m<sup>3</sup></p> <p><b>Percent change (95% CI):</b> 48h mean PM<sub>2.5</sub>: 20.8% decrease in HF (95% CI: 4.6%, 34.2%) 18.6% increase in LFHFR (4.1%, 35.2%).</p> <p><b>Notes:</b> Subjects were monitored during a 4-min rest period between 8 a.m. and 1 p.m. Modifying effects of hypertension, IHD, diabetes, and use of cardiac/antihypertensive medications also examined. Linear regression analyses. This subject group is from the VA Normative Aging Study. The 4-h averaging period was most strongly associated with HRV indices. The PM effect was robust in models including O<sub>3</sub>. The HRV change per IQR increase in PM<sub>2.5</sub> were larger in subjects with hypertension (n = 335) IHD (n = 142), and diabetes (n = 72). In addition, those who did not use calcium-channel blockers had a greater decline in LF associated with each IQR increase in PM<sub>2.5</sub> than did those who did use calcium channel blockers. IQR increases in 48h mean BC concentration were also associated with adverse changes in HRV, suggesting traffic pollution may be particularly toxic.</p>
