DISCLAIMER

This document summarizes the discussions presented at the Dioxin Workshop in February 2009, in Cincinnati, OH, as documented by the Session Co-Chairs. This document is not all inclusive or binding. Conclusions and recommendations to the U.S. EPA may not represent full consensus. The views expressed in this document are those of the Dioxin Workshop Panelists and do not necessarily reflect the views and policies of the U.S. Environmental Protection Agency. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

DIOXIN WORKSHOP TEAM

The Dioxin Workshop Team, under the leadership of Peter W. Preuss, Director, NCEA, comprised the following members:

National Center for Environmental Assessment, Office of Research and Development,
U.S. Environmental Protection Agency, Cincinnati, OH 45268

Belinda S. Hawkins
Janet Hess-Wilson
Glenn Rice
Jeff Swartout
Linda K. Teuschler
Bette Zwayer

Argonne National Laboratory, Argonne, IL 60439

Maryka H. Bhattacharyya
Andrew Davidson
Mary E. Finster
Margaret M. MacDonell
David P. Peterson

INTRODUCTION

This document provides a summary of the Scientific Workshop to Inform EPA's Response to National Academy of Science Comments on the Health Effects of Dioxin in EPA's 2003 Dioxin Reassessment. The U.S. Environmental Protection Agency (U.S. EPA) and Argonne National Laboratories (ANL), through an inter-Agency agreement with the U.S. Department of Energy, convened this scientific workshop ("Dioxin Workshop") on February 18–20, 2009, in Cincinnati, Ohio. The goals of the Dioxin Workshop were to identify and address issues related to the dose-response assessment of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD). This report summarizes the discussions and conclusions from this workshop. Previously, at the request of the U.S. EPA, the National Academy of Sciences (NAS) prepared a report, *Health Risks from Dioxin and Related Compounds: Evaluation of the EPA Reassessment* (NAS, 2006), which made a number of recommendations to improve the U.S. EPA's risk assessment for TCDD (U.S. EPA, 2003). The 3-day Dioxin Workshop was convened specifically to ensure that the U.S. EPA's response to the NAS recommendations focuses on the key issues and reflects the most meaningful science.

The Dioxin Workshop included seven scientific sessions:

- (1) Session 1: Quantitative Dose-Response Modeling Issues
- (2) Session 2: Immunotoxicity
- (3) Session 3A: Dose-Response for Neurotoxicity and Nonreproductive Endocrine Effects
- (4) Session 3B: Dose-Response for Cardiovascular Toxicity and Hepatotoxicity
- (5) Session 4A: Dose-Response for Cancer
- (6) Session 4B: Dose-Response for Reproductive/Developmental Toxicity
- (7) Session 5: Quantitative Uncertainty Analysis of Dose-Response

During each session, the U.S. EPA asked a panel of expert scientists to:

- identify and discuss the technical challenges involved in addressing the key NAS comments on the TCDD dose-response assessment in the U.S. EPA Reassessment (U.S. EPA, 2003);
- discuss approaches for addressing the key NAS comments; and
- identify important published, independently peer-reviewed literature, particularly studies describing epidemiologic and *in vivo* mammalian bioassays, which are expected to be most useful for informing the U.S. EPA's response.

The sessions were followed by open comment periods during which members of the audience were invited to address the Panels. At the conclusion of the open comment periods, the Panel Co-Chairs were asked to summarize and present the results of the panel discussions. The summaries could include minority opinions stated by panelists. The main points derived from the session summaries were used to prepare this document. Additionally, this document includes a list of the session panelists and their affiliations and three appendices. Appendix A presents the Dioxin Workshop Agenda. Appendix B identifies the charge questions presented to the Panel. Appendix C describes draft study selection criteria proposed by the Dioxin Workshop Team for consideration by the workshop panelists.

This document is a draft for review purposes only and does not constitute Agency policy.

SCIENTIFIC WORKSHOP TO INFORM THE TECHNICAL WORK PLAN FOR U.S. EPA'S RESPONSE TO NAS COMMENTS ON THE HEALTH EFFECTS OF DIOXIN PRESENTED IN U.S. EPA'S DIOXIN REASSESSMENT

Dioxin Workshop Co-Chairs: Peter W. Preuss and Glenn Rice

The Dioxin Workshop session summaries were prepared by the session panel Co-Chairs with input from the panelists, as requested by the U.S. EPA prior to the workshop. The Co-Chairs subsequently presented these summaries to all of the workshop participants during designated periods at the workshop. In these summaries, the U.S. EPA asked that the Co-Chairs summarize the key issues from the panel discussions. Because the sessions were not designed to achieve consensus among the panelists, the summaries do not necessarily represent consensus opinions; rather, they reflect the essence of the panel discussions. Some of the specific points may represent the views of multiple panelists, while others only the views of a single panelist. Prior to the summarizations, there were opportunities for public comments on the discussion topics. Some Co-Chairs met with their sessions' panelists after their sessions ended to develop these summaries, while others developed reports based on their personal notes. Because Session 5 was the last session of the workshop—with little time provided to develop the summary—the Co-Chairs circulated a draft for comment by the Session 5 panelists after the workshop, prior to finalizing the session summary. The U.S. EPA collected the session summaries and then prepared this document. A draft of this document was distributed to all of the session Co-Chairs to provide them with a final opportunity to comment and make revisions. Finally, it should be noted that U.S. EPA was not prescriptive to the session Co-Chairs with respect to the format of the presentation materials and provided no specific instructions, resulting in unique formats among the session summaries.

SESSION 1: QUANTITATIVE DOSE-RESPONSE MODELING ISSUES

This session discussed the general dose-response modeling issues related to TCDD. Many of these issues were highlighted by NAS (2006). There was a general introductory presentation on TCDD kinetics, including information and uncertainties pertaining to the conversion of administered doses in animals to human body burden (BB) and additivity to background issues. This presentation was followed by a Panel discussion on the state of the science regarding dioxin dose-response modeling issues.

Session 1 Panelists (Session Co-Chairs are identified by asterisk)

- Bruce Allen, Bruce Allen Consulting
- Lesa Aylward, Summit Toxicology
- Roger Cooke, Resources for the Future
- Kenny Crump, Louisiana Tech University
- Mike DeVito, U.S. EPA
- Dale Hattis, Clark University
- Rick Hertzberg, Biomath Consulting
- Rob McDowell, U.S. Department of Agriculture
- Jim Olson, State University of New York, University at Buffalo

This document is a draft for review purposes only and does not constitute Agency policy.

- *Lorenz Rhomberg, Gradient
- Woody Setzer, U.S. EPA
- *Jeff Swartout, U.S. EPA

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-Chair and represent a synopsis of the panel discussions.

Key Study Selection Criteria

The Panel discussed the advantages and disadvantages of using key study criteria (Appendix C). They concluded that *a priori* criteria foster transparency and consistency, and could deflect *a posteriori* criticism. However, the Panel also acknowledged that having *a priori* criteria could introduce the potential for excluding useful data. Although the key study criteria provided by the U.S. EPA listed studies using TCDD only as a criterion, the Panel posed the possibility of using closely related dioxin-like compounds (DLCs) as surrogates for TCDD. The criterion for use of data from mammalian studies only was one criterion that received generalized support due to the lack of extrapolation protocols for nonmammalian species. The Panel also discussed the specific exposure-duration criterion and asked if there should be a preference for longer-term rather than acute studies. The Panel made three suggestions to modify U.S. EPA’s key study selection criteria:

- (1) Define more relevant exposure-level (i.e., dose) cut points using tissue concentrations.
- (2) Reword statistical criteria to include do-it-yourself analysis.
- (3) Reword the response criteria to clarify “outside of normal range.”

Dose Metrics

The Panel discussed the relative merits of various measures of dose for modeling TCDD dose response. One general conclusion was that tissue concentration (TC) is the preferred metric, especially lipid-adjusted TC, because this measure more closely approximates exposures close to the target tissue when compared to administered doses. However, the Panel acknowledged that these data are often unavailable. They further noted that BB, which is defined as the concentration of TCDD in the body (ng/kg body weight) (U.S. EPA, 2003), might be useful as a surrogate for TC provided the two measures were proportional.

The Panel suggested that a linear approach to BB estimation, which was utilized by U.S. EPA (2003), is too simplistic because this approach does not take into account toxicokinetic issues related to TCDD—e.g., sequestration in the liver and fat, age-dependent elimination, and changing elimination rates over time. The Panel recommended the use of kinetic/mechanistic modeling to the extent possible to quantify tissue-based metrics.

The Panel raised the issue of whether the preferred dose metric would be different for different endpoints and exposure durations. This led to the Panel’s comment that the peak exposure might be a more important metric than average BB for variable exposure scenarios. Given this discussion about different exposure durations being relevant to a specific endpoint, the Panel suggested that the U.S. EPA also consider peak measures in dose-response modeling.

This document is a draft for review purposes only and does not constitute Agency policy.

The last point raised in this part of the discussion centered on the possibility of dose errors in experimental studies. The Panel highlighted the need for the U.S. EPA to consider dose error (i.e., uncertainty in the x-axis of the dose-response curve) when using dose surrogates.

Dose-Response Modeling of Mammalian Bioassays

The Panel considered several issues related to dose-response modeling of mammalian bioassay data for TCDD: supralinearity and incomplete response data (“anchoring”), defining the benchmark response (BMR) level with respect to establishing the point of departure (POD), and the use of threshold modeling—as further explained below.

The Panel discussed the specific issues of supralinearity and anchoring raised by the U.S. EPA with respect to modeling noncancer endpoints. The panel recognized that, for many of the most sensitive endpoints, the response at the lowest dose is high (e.g., quantal responses above 25% and continuous endpoints differ substantially from the mean, often implying 100% incidence in the treated animals). This lack of response anchoring at the low end of the dose-response curve (near the BMR) results in the higher responses determining the shape of the curve.

The Panel asked whether new tools might be needed or whether the current tools could be applied differently. In the context of developing new tools, the Panel emphasized the need for collaboration between biologists and mathematicians. When discussing application, the Panel suggested that the problem with supralinearity might be overcome by simply dropping the requirement for using the lower bound on the Benchmark Dose. In addition, the Panel posed several more approaches for further consideration in dose-response modeling by the U.S. EPA:

- (1) Combine similar data sets to fill in data gaps.
- (2) Use mechanistic approaches to model the data gaps.
- (3) Dichotomize continuous data.

Finally, the Panel acknowledged that, in certain situations, there simply may not be enough information to provide meaningful answers.

The Panel discussed the BMR level for establishing a POD in the context of deriving a Reference Dose (RfD). The Panel generally agreed that, while the effective dose level (ED_{01}) used in the 2003 Reassessment may be useful for comparative analysis across endpoints, the ED_{01} estimates developed for all endpoints considered in the Reassessment were not appropriate for deriving an RfD because they were not based on the effect’s adversity. The panel noted that ED_{01} also is much lower than typical EPA BMR levels. The Panel recommended that the U.S. EPA work to define endpoint-specific BMRs based on the consideration of adversity. Given that the same uncertainty factor framework is applied to all PODs, the Panel emphasized the need for consistency in BMRs; numerical consistency is needed for quantal BMRs and consistency in the choice of biological relevance should be applied for continuous BMRs.

The Panel generally discouraged threshold modeling by stating that thresholds are very difficult to pin down and suggested that the lower bound may always be zero.

This document is a draft for review purposes only and does not constitute Agency policy.

Dose-Response Modeling of Epidemiological Studies

The Panel noted that many studies have been published with measured concentrations of TCDD that could be used for dose reconstruction. In this discussion, the Panel acknowledged that use of these data would entail dealing with toxicity equivalence (TEQ) issues and pharmacokinetic (PK) modeling. Pertaining to the use of these data for quantitative risk assessment by the U.S. EPA, the Panel posed the question, “At what point does indirect or confounded human data supersede controlled animal bioassay data?”, or alternatively, “How much human data uncertainty can we tolerate?” The Panel suggested, at the least, that the epidemiologic data could be used to “ground-truth” the animal bioassay modeling results.

Supporting Information

The Panel acknowledged that Ah receptor (AhR) binding affinities are not necessarily tied to endpoint sensitivity, but they reiterated the need to consider mechanistic modeling to aid in developing appropriate dose metrics or filling in data gaps in the existing dose-response data.

SESSION 2: IMMUNOTOXICITY

The U.S. EPA plans to consider development of a quantitative dose-response assessment for the immunologic effects associated with TCDD exposure. Such an assessment would be based on information in U.S. EPA (2003), NAS (2006) and key studies identified in this workshop. The purpose of this session was to identify and discuss key issues pertaining to dose-response assessment for dioxin-induced immunologic effects.

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-Chair and represent a synopsis of the panel discussions.

Key Study Selection Criteria

The Panel first addressed the Key Study Selection Criteria proposed by the U.S. EPA (Appendix C). The Panel raised the issue that the key study criteria do not apply to most studies designed to investigate immunotoxicity, including those used to calculate ED_{01s} (U.S. EPA, 2003). The Panel observed that most dioxin immunotoxicity studies are relatively high dose (>200 ng/kg-d) acute studies and/or use parenteral rather than oral administration.

The Panel discussed several studies often considered important for assessing the immunotoxic effects of TCDD exposure. The Oughton et al. (1995) mouse bioassay was discussed and, although the study does meet the proposed criteria, it could not be considered a key study; specifically, the Panel contended that since there were no functional alterations observed or measured in this bioassay, the changes in cellular phenotypes are only “suggestive” of immune alterations and cannot be regarded as having immunopathologic significance.

The Panel discussed two additional studies for further consideration by the U.S. EPA:

- Baccarelli et al. (2002). The Panel discussed this as a potentially key human epidemiological study that should be reviewed and considered further by the U.S. EPA. It measured the level of IgG, demonstrating a significant decline relative to dioxin body burdens.
- Smialowicz et al. (2008). The Panel noted that this study identified the antibody response to sheep red blood cells (SRBCs) as the critical effect, labeling this protocol as a functional assay. The Panel stated that if modeled, the U.S. EPA could calculate the BMR for this endpoint as 1 standard deviation from the control mean.

SESSION 3A: DOSE-RESPONSE FOR NEUROTOXICITY AND NONREPRODUCTIVE ENDOCRINE EFFECTS

The U.S. EPA plans to consider development of a quantitative dose-response assessment for neurological and/or nonreproductive endocrine effects associated with TCDD exposure. Such an assessment would be based on information in U.S. EPA (2003), NAS (2006) and key studies identified in this workshop. The purpose of this session was to identify and discuss key issues pertaining to dose-response assessment for dioxin-induced neurological and/or nonreproductive endocrine effects.

What Are the Key Questions Regarding These Endpoints?

The Panel used the following question to initiate discussion: “*Are there identifiable indices of neurotoxicity and nonreproductive endocrine effects in animal studies and human populations?*” Under this discussion topic, the Panel discussed three endpoints: neurotoxicity (with focus on developmental exposures), thyroid dysfunction (e.g., thyroid hormone deficits), and diabetes. The Panel also addressed the relevance of windows of vulnerability to each

This document is a draft for review purposes only and does not constitute Agency policy.

endpoint. The Panel acknowledged that, in some cases, the window of exposure may precede the window of expression of toxicity.

Epidemiological Study Selection

Developmental Neurotoxicity

The Panel recognized that an unusual feature for this endpoint is that there are sufficient human data for dose-response modeling (e.g., Dutch children [Huisman et al., 1995; Patandin et al., 1999] and U.S. children [Jacobson and Jacobson, 1996]) and there is an internal dose metric (serum concentrations). Additionally, the Panel discussed recent studies that address this endpoint in humans (from Japan [reference not provided] and Holland [e.g., Koopman-Esseboom et al., 1996; Vreugdenhil et al., 2002]). For continued investigation into this endpoint, the Panel raised two issues to the U.S. EPA:

- Conduct an evaluation of whether a modeled effect can be attributed to TCDD and not some other persistent organic pollutant (POP), although the Panel recognized that it is unlikely U.S. EPA will be able to distinguish among these exposures because other POPs are intrinsic confounders in the Dutch study.
- Allow animal data to inform the dose-response modeling of epidemiological data.

Thyroid Dysfunction

The Panel identified the availability of human data for this endpoint (e.g., Calvert et al., 1999; Koopman-Esseboom et al., 1994). Much of the thyroid dysfunction literature has been published since the 2003 Reassessment (e.g., Wang et al., 2005; Baccarelli et al., 2008). The Panel also noted the availability of an internal dose metric (serum concentrations). Additionally, the Panel discussed the mechanistic studies in animals that link TCDD to thyroid dysfunction. For continued investigation into this endpoint, the Panel raised three issues for the U.S. EPA to consider:

- Consider the newly available human data since the Reassessment.
- Investigate and clarify of the role of TCDD-induced thyroid dysfunction in developmental neurotoxicity.
- Evaluate and determine whether an effect can be attributed to TCDD or other contaminants.

Diabetes

The Panel discussed that data suggest that diabetes incidence in those under 55 years old may be associated with exposure to PCBs. They acknowledged that whether this is a dioxin-like compound (DLC) mediated effect or whether other POPs are responsible is still undetermined. The Panel also acknowledged that no animal model exists for the investigation of xenobiotic-induced diabetes, and that separating the injury dose level from the current body burdens would depend on good pharmacokinetics in humans. For continued investigation into this endpoint, the Panel listed two issues for the U.S. EPA to consider:

- Results from the Anniston study and the Great Lakes Fishermen study (references not provided) should be examined for dose metrics (both studies examine human PCB exposures).

This document is a draft for review purposes only and does not constitute Agency policy.

- Changes of adipose tissue status need to be considered, given that dieting can cause release of lipid-soluble contaminants.

SESSION 3B: DOSE-RESPONSE FOR CARDIOVASCULAR TOXICITY AND HEPATOTOXICITY

The U.S. EPA plans to consider development of a quantitative dose-response assessment for cardiovascular and/or hepatic effects associated with TCDD exposure. Such an assessment would be based on information in U.S. EPA (2003), NAS (2006) and key studies identified in this workshop. The purpose of this session was to identify and discuss key issues pertaining to dose-response assessment for dioxin-induced cardiovascular and/or hepatic effects.

- Jim Olson, State University of New York, University at Buffalo
- Marian Pavuk, Agency for Toxic Substances and Disease Registry
- *Jeff Swartout, U.S. EPA
- *Mary Walker, University of New Mexico
- Nigel Walker, National Institute of Environmental Health Sciences

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-chair and represents a synopsis of the panel discussions.

Key Study Selection Criteria

The Panel initially focused on the draft key study selection criteria offered by the U.S. EPA (Appendix C). The panel recommended that for cardiovascular effects, which are not usually observed in rodents, the use of knockout mouse models (ApoE KO and LDLR KO) be moved to the “primary” column because only these studies establish the cardiovascular toxicity model in mice.

The panel also was concerned that the gavage procedure can increase mouse blood pressure. Consequently, the panel recommended that gavage studies not be used for the blood pressure endpoint (i.e., only dietary dosing studies should be considered).

Human Health Endpoints

In relation to the hepatic endpoint, the Panel acknowledged the large body of dose response information on hepatic effects in rodents and that enzyme (mostly CYP1A1) induction was a sensitive effect. However, the Panel cited the lack of linkage of CYP1A1 to downstream events, which complicates the toxicological interpretation of this endpoint, and concluded that

This document is a draft for review purposes only and does not constitute Agency policy.

the more important liver effects in rodents are probably on the “road to cancer.” The Panel noted that hepatic effects were not seen in the epidemiological studies, but acknowledged that these studies were not designed to detect them.

In relation to the cardiovascular endpoint, the Panel identified hypertension and ischemic heart disease (IHD) as two key endpoints from the epidemiological studies. The Panel recommended that the U.S. EPA perform a meta-analysis of these data. The Panel also commented that recent animal studies support the observations linking TCDD exposure to IHD and hypertension. In particular, the National Toxicology Program (NTP) study shows inflammatory and structural effects on resistant vascular arterioles (NTP, 2006). Additional evidence from the study suggests that the vascular effects may be CYP1A1-dependent. The Panel suggested that the NTP study data might be used as a surrogate for dose-response modeling of hypertension and that such an approach would be supported by data on the role of AhR in vascular function and remodeling.

POD Issues

The Panel was not supportive of 1% of maximal response (ED_{01}), which was utilized in the 2003 Reassessment. The Panel concluded that the POD should depend on the specific endpoint and recommended the following to the U.S. EPA:

- For continuous measures, base the BMR on difference from control. Consider the adversity level—at what point does the endpoint become adverse?
- For incidence data, set the BMR to a fixed-risk level.

Supporting Information

The Panel posed several suggestions to the U.S. EPA for reducing uncertainty and improving the knowledge base for TCDD toxicity.

- Use in vitro data to define uncertainties, such as the relative sensitivity between rodents and humans and around the definition of a POD.
- Consider studies on dioxin-like compounds (DLCs).
- Use PK modeling to define the dose metric for hepatic effects.
- Use body burden or serum concentrations for cardiovascular endpoints.

Finally, the Panel recommended that U.S. EPA finish the reassessment quickly and establish a definitive plan to review and incorporate new data as they become available.

SESSION 4A: DOSE-RESPONSE FOR CANCER

The U.S. EPA plans to consider development of a quantitative dose-response assessment for cancer associated with TCDD exposure. Such an assessment would be based on information in U.S. EPA (2003), NAS (2006) and key studies identified in this workshop. The purpose of this session was to identify and discuss key issues pertaining to dose-response assessment for dioxin-induced cancer.

Session 4A Panelists (Session Co-Chairs are identified by asterisk)

- Lesa Aylward, Summit Toxicology
- Kenny Crump, Louisiana Tech University
- Dale Hattis, Clark University
- *Janet Hess-Wilson, U.S. EPA
- Karen Hogan, U.S. EPA
- Manolis Kogevinas, Centre for Research in Environmental Epidemiology
- Marian Pavuk, Agency for Toxic Substances and Disease Registry
- Chris Portier, National Institute of Environmental Health Sciences
- Lorenz Rhomberg, Gradient
- Jay Silkworth, General Electric
- *Nigel Walker, National Institute of Environmental Health Sciences

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-chair and represent a synopsis of the panel discussions.

Key Study Selection

The Panel discussed both human and rodent studies. In reviewing the epidemiological data, the Panel agreed the EPA should focus on four cohort studies (Dutch cohort, NIOSH cohort, BASF accident cohort, and Hamburg cohort) and pointed out that there are numerous updates and reevaluations of data now in the literature and others will be published soon. The Panel stated that it is appropriate for the U.S. EPA to consider the increase in total cancers for modeling human cancer data, however, Non-Hodgkin's lymphoma, and lung tumors are the main TCDD-related cancer types seen in humans exposed to TCDD. The Panel suggested the U.S. EPA focus the quantitative dose-response modeling on the human data.

This document is a draft for review purposes only and does not constitute Agency policy.

In reviewing the rat data, the Panel identified four new NTP rodent cancer bioassays with liver and lungs as the main target organs. However, they suggested that dose-response modeling efforts should model “all cancers” from these NTP data sets as well and use tumor incidence—not individual rats as measures.

Key Study Selection Criteria

The Panel discussed whether data for TCDD only should be used or if PCB126 could be used to develop a dose-response curve. From this discussion, the Panel reached a general agreement that limiting the dose-response modeling and cancer assessment to TCDD only would be the best approach.

Regarding the oral dosing regimens, the Panel discussed the differences in results from different bioassays. They concluded that there were insufficient data to pick between oral feed (Kociba et al., 1978) and oral gavage (NTP, 2006) studies, but stated “If all aspects of studies were equal, an oral feed study is preferred.” However, given that current data sets are not equal, they agreed that U.S. EPA should consider both feed and gavage studies.

The Panel put forth the recommendation that studies that include initiation-promotion model data and TgAC transgenic model data from oral exposure studies should be excluded from the primary category in the key study selection criteria (Appendix C lists the draft study selection criteria distributed prior to the meeting). Studies from both classifications should be moved to the second tier.

The Panel was also unsupportive of the “response magnitude outside the range of normal variability” criterion, as they did not believe it was applicable to a cancer endpoint.

Critical Endpoints to Consider

The Panel recognized that the MOA for TCDD includes cell growth/differentiation dysregulation, that different endpoints (tumor types) across species may be expected, and that there are differences in tumor sites across species. The Panel further acknowledged that there is insufficient information to determine if rodent tumor types observed are relevant to humans. Thus, the Panel suggests the following:

- U.S. EPA should consider all the observed cancer endpoints in its evaluation.

Nonlinear (aka threshold) Versus Linear Dose-Response Modeling

The Panel agreed that NTP bioassays appear to demonstrate nonlinear dose response, but they expressed concern about using animal data to infer slope and dose response for humans. The Panel pointed out that there are differences in slopes across different bioassays, and specifically, that some appear linear while others appear nonlinear. Given the observation of both nonlinear vs. linear, the Panel concluded that neither could be ruled out for extrapolation below the POD simply based on the available data. One panelist noted that U.S. EPA Cancer Guidelines (U.S. EPA, 2005) state that only if one can demonstrate that the MOA has a threshold dose-response shape, and can exclude all other potential linear MOAs, can one use a nonlinear model. Lastly, the Panel noted that there are data and rationales to support use of both linear and

This document is a draft for review purposes only and does not constitute Agency policy.

nonlinear response below POD. From this discussion, the Panel raised one possibility to the U.S. EPA:

- Both linear and nonlinear model functions should be considered in the dose-response analysis.

Dose Metrics

In considering human data, the Panel expressed a preference for lipid-adjusted serum levels over body burden (BB), and they expressed concerns over the assumptions used in the back calculation of the BB in the epidemiologic cohorts. In considering the rat data, the Panel supported the use of BB—especially lipid-adjusted BB. The Panel, however, did express concern over the sequestering of TCDD in liver and then the use of liver levels in BB calculations.

Supporting Information—Biologically-Based Dose-Response (BBDR) Models and MOA

The Panel discussed BBDR. Though once considered an attractive proposition, BBDR models may mask uncertainty within the models, necessitating them to be used with greater caution. The Panel suggested two issues for the U.S. EPA to consider:

- If there is a published model, use it if it is valid—do not generate a new model.
- Focus on the actual experimental data to drive the analysis.

SESSION 4B: DOSE-RESPONSE FOR REPRODUCTIVE/DEVELOPMENTAL TOXICITY

The U.S. EPA plans to consider development of a quantitative dose-response assessment for reproductive and developmental effects associated with TCDD exposure. Such an assessment would be based on information in U.S. EPA (2003), NAS (2006) and key studies identified in this workshop. The purpose of this session was to identify and discuss key issues pertaining to dose-response assessment for dioxin-induced reproductive and developmental effects.

- Brian Petroff, University of Kansas
- *Glenn Rice, U.S. EPA
- Marie Sweeney, National Institute of Occupational Safety and Health
- Mary Walker, University of New Mexico
- Bernie Weiss, University of Rochester

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-Chair and represent a synopsis of the panel discussions.

A Major Question Posed During this Workshop Session was “Are Human Embryos and Infants Less Sensitive to Dioxin Exposures Than Some Experimental Animals?”

The Panel recognized that animal data show a wide range of species sensitivity to dioxin for a given developmental or reproductive endpoint. Presently, there are data for some endpoints that show that human sensitivity is comparable to experimental animals (e.g., semen quality), and for other endpoints the data demonstrate that humans are insensitive compared to other species (e.g., cleft palate). Lastly, the Panel recognized that there are some endpoints for which relative human sensitivity remains uncertain.

Key Study Selection

The Panel reviewed the charge questions (Appendix B), discussed them, and listed two issues for the U.S. EPA to consider:

- Concerning key study determination, use a stepwise approach that is dependent upon the information available and needed to address the question.

This document is a draft for review purposes only and does not constitute Agency policy.

- Concerning the key studies informing the POD and the POD endpoint choice, use the POD to depart from what is certain and use a high-confidence study that has found effects at a low enough level at which other effects are protected.

The Panel also developed Table 1, based on the information presented in this session. Table 1 identifies specific reproductive and developmental effects of concern, listing whether an effect has been observed in test animals and epidemiologic cohorts. It also identifies the ED₁₀ estimated by the U.S. EPA (2003) for health effects observed in rodent bioassays. If the U.S. EPA did not report an ED₁₀ for an effect, the table identifies a study where the effect was reported and the lowest study dose where the effect was observed. Table 1 also identifies the epidemiologic cohort where the specific reproductive and developmental effects were observed.

Epidemiological Study Utility

The Panel reviewed the charge questions (Appendix B), discussed them, and made two suggestions to the U.S. EPA:

- Concerning the ability of epidemiological studies to inform critical effects, start with concordance across species (including humans) for the spectrum of effects.
- Concerning the ability of epidemiological studies to inform dose-response modeling, start with the epidemiology and then go to animal data if the dose response has not been well characterized for an endpoint of interest and compare to animal data as a reality check.

Animal Model Utility

The Panel reviewed and discussed the charge questions (Appendix B). Table 1, which identifies the effects that occur in animals and also have relevance to humans, summarizes much of this discussion. Regarding the influence of mode of action (MOA) on animal model choice, the Panel concluded that by evaluating concordance among health effects reported in epidemiologic and animal bioassay data, the U.S. EPA could identify a set of plausible reproductive and developmental effects to consider. Actual animal and human MOA information is helpful in that it creates comfort with the animal models and in defining the boundaries of possible effects.

TABLE 1			
Reproductive/Developmental Effects of Concern for Human Health			
Endpoint	Rodent (ED ₁₀ ng/kg-d)	Human	Notes
Sperm Count/Motility	Yes (6.2–28; 66–200)	Yes	ED ₁₀ bases Mabley et al. (1992a,b) caudal sperm count and daily sperm production range from 6.2–28; Gray et al. (1997) epididymal sperm count and total testis sperm counts range from 66–200.
Sex Ratio	No	Yes, Seveso	
Delayed Puberty Males	Yes (94)	Yu-cheng	ED ₁₀ basis rat male puberty delay Gray et al. (1997). Need to qualify epidemiology data because of cohort PCDD/PCDFs exposures.
Delayed Puberty in Females	Yes	No in Seveso	Gray and Ostby (2002) report delayed puberty in female offspring of pregnant rats receiving a single dose of 1 µg TCDD/kg on GD 15.
Cleft Palate	Yes (6300–6400)	No	ED ₁₀ basis Birnbaum et al. (1989).
Premature Senescence	Yes	No, Seveso	Franczak et al. (2006) report that rats prematurely entered reproductive senescence, after receiving cumulative TCDD doses as low as 1.7 µg TCDD/kg. They considered first occurrence of prolonged interestrus interval (>6 d) as evidence of onset of reproductive senescence.
Hormones E2	Yes	Yes, Males— Seveso	Li et al. (1995) report serum estradiol-17β (E2) concentrations induced by equine Chorionic Gonadotropin injection were significantly elevated in female rats orally administered 10 µg/kg TCDD on PND 22. While E2 decreased dramatically in control animals during the preovulatory LH surge, it did not in TCDD-treated rats.
Low Birth Weight	Yes (190)	Suggestive effect in Seveso in first 8 years after exposure	ED ₁₀ basis Gray et al. (1997).
Reproductive Cycling (prolongation)	Yes	Yes, Seveso Prepubertal exposure	Franczak et al. (2006) report loss of normal cyclicity in female rats at 8 months of age following a cumulative dose of 1.7 µg TCDD/kg.

This document is a draft for review purposes only and does not constitute Agency policy.

Supporting Information

The Panel reviewed the charge questions (Appendix B), discussed them, and made two suggestions to the U.S. EPA:

- Concerning deviation from default approaches for noncancer endpoints, there needs to be a careful assessment of the POD and the application of uncertainty factors in light of PK/pharmacodynamics (PD), population characteristics and variability, and MOA information.
- Concerning the MOA's ability to clarify endpoint and the incorporation of a cascade of cellular event into dose-response for noncancer endpoint, any study that helps inform the dose response should be considered—including studies not specific to dioxins. Complicated mechanistic models need not be developed. Standard dose-response models can be applied. One can look at the cascade of events in a stepwise, simple way.

SESSION 5: QUANTITATIVE UNCERTAINTY ANALYSIS OF DOSE-RESPONSE

This session addressed the uncertainty analysis to be considered for the dose-response assessments. The session opened with a presentation on current estimates of dioxin exposure levels. Then it focused on the factors to include in the scope of an uncertainty analysis including dioxin kinetics.

Session 5 Panelists (Session Co-Chairs are identified by asterisk)

- Bruce Allen, Bruce Allen Consulting
- Lesa Aylward, Summit Toxicology
- Roger Cooke, Resources for the Future
- Kenny Crump, Louisiana Tech University
- Mike DeVito, U.S. EPA

- Nancy Kerkvliet, Oregon State University
- Leonid Kopylev, U.S. EPA
- Rob McDowell, U.S. Department of Agriculture
- Lorenz Rhomberg, Gradient
- Woody Setzer, U.S. EPA
- Marie Sweeney, National Institute of Occupational Safety and Health
- *Linda Teuschler, U.S. EPA

Please note that the use of the term “concluded” or “recommended” in this summary does not mean that a consensus was reached. Session Summaries were written from the material prepared by the non-EPA/ANL Co-Chair and represent a synopsis of the panel discussions.

The Panel summarized the NAS comments regarding uncertainty. Areas for improvement include:

- Ensure “transparency, thoroughness, and clarity in quantitative uncertainty analysis.”
- Describe and define (quantitatively to the extent possible) the variability and uncertainty for key assumptions used for each key endpoint-specific risk assessment, including choices of data set, point of departure, dose-response model, and dose metric.
- Incorporate probabilistic models to represent the range of plausible values.

This document is a draft for review purposes only and does not constitute Agency policy.

- Assess goodness-of-fit of dose-response models.
- Provide upper and lower bounds on central tendency estimates for all statistical estimates.
- When quantification is not possible, clearly state it, and explain what would be required to achieve quantification.

Identification of Important Uncertainties

The Panel reviewed the charge questions (Appendix B), discussed them, and listed eight issues for consideration by the U.S. EPA:

- Concerning species and strain differences in the U.S. EPA’s Response to NAS, current U.S. EPA procedures do not take this into account when selecting one data set for risk assessment. Issues include “Where are humans in the distribution of potencies that can be generated? How likely is it that human response is similar to the selected data? Can we infer inter-individual variability from these differences?”
- Concerning the use of animal data for cross species extrapolation to humans (PK and PD uncertainties), issues to consider include differences in distribution and responses following bolus doses from those of subchronic and chronic protocols; uncertainty in liver doses due to sequestration; differences in receptor binding affinity among congeners; and age factors (e.g., assumption of a lifetime constant daily dose for a cancer extrapolation).
- Concerning the description of AhR response, biochemical changes occur at lower doses than toxicological changes. There should be an effort to identify the biochemical changes that would mark Ah receptor binding to inform the BMR, and, thus, prevent toxicity.
- Concerning model uncertainty, the mathematical model choice depends on endpoint. There should be an effort towards determining what is the most sensitive endpoint(s) for humans and conducting animal studies to model that endpoint(s).
- Concerning exposure and dose response in human studies, ensure enough similarity to current human exposure profiles (mixture composition) so that a dose-response assessment can be done. Incorporate new epidemiological studies. Evaluate concordance with animal data and consistency across studies. Panel-acknowledged uncertainties include exposure estimates from person to person, shape of human dose-response curve, healthy worker effect, and age dependence.
- Concerning POD determination, uncertainty factors are inherently mathematically inconsistent and that should be conveyed in the discussion of uncertainties when interpreting the POD.
- Concerning dose metric, tissue concentration is preferred. It should be evaluated against a background of variability in AhR-binding expression. There is uncertainty in what level of binding should be considered, in different cell types, tissues, life stage (development). The relationship between dose metric and causation of adverse effects should be examined.

This document is a draft for review purposes only and does not constitute Agency policy.

Low-Dose Extrapolation

The Panel reviewed the charge questions and discussed them (Appendix B). The Panel concluded that curve-fitting uncertainty (for a given dataset, dose metric, and model) can be characterized and is useful, but, by itself, it is an incomplete characterization of uncertainty. The Panel acknowledged the difficulty of fully characterizing uncertainty, especially quantitatively. Some panelists argued that the problem is insurmountable and that no meaningful uncertainty analysis is likely to be performable. Other panelists contended that, the difficulties notwithstanding, “good-faith” efforts to do something practical and forthright to characterize uncertainty in low-dose extrapolation would be useful and important. The Panel clarified “good faith” as meaning a characterization that is useful and not misleading to decision makers and is inclusive of approaches that have meaningful support in the scientific community as a whole. Being in “good faith” is more important than being complete (i.e., addressing every uncertain element), especially since completeness is not a realistic goal. From this discussion, the Panel listed four issues for consideration by the U.S. EPA:

- Review alternative data sets, dose metrics, and models to see where consequential uncertainties and impacts on low-dose implications arise.
- Consider the impacts of choices among plausible alternative data sets, dose metrics, models, and other more qualitative choices—issues include how much difference the choices make and also how much relative credence should be put to each alternative as a way of gauging and describing the landscape of imperfect knowledge regarding possibilities for the true dose-response.
 - Hard to do quantitatively, since the factors are not readily expressed as statistical distributions, but can describe the rationale for believing/doubting each alternative in terms of available supporting evidence, contrary evidence, and needed assumptions.
 - Expert judgment methods may be helpful in characterizing the relative weights of scientific credibility among alternatives. The expert judgment process, when conducted systematically, can be thought of as adding data to the assessment of credibility of alternatives, rather than as just an opinion poll.
 - Information on plausibility of alternative low-dose extrapolation approaches can come from external considerations of mode of action, and not just from statistical success at fitting particular (high-dose) data sets.
- Characterizing uncertainty through a variety of approaches could be tried, and their relative merits and shortcomings discussed, as a way forward.
- Consider the sources of potential error, particularly in epidemiological data (e.g., TEF uncertainty and variation in congener mixtures) and if possible quantify their impact on the dose-response assessment.

Considerations for Conducting Uncertainty Analysis

Overall, the Panel was split on whether U.S. EPA should do quantitative uncertainty analyses. The Panel noted that if done on only some of the uncertainties, then results would be misleading and could be misused. Ultimately, the Panel listed seven issues for consideration by the U.S. EPA:

This document is a draft for review purposes only and does not constitute Agency policy.

- The Panel recapped what some consider as being the first integrated risk assessment, with structured expert judgment and uncertainty analysis, i.e., the Rasmussen Report (WASH-1400; U.S. Nuclear Regulatory Commission, 1975). In their discussion of the report, the Panel noted that in addition to standard event tree/fault tree modeling, this report also tackled difficult model uncertainty issues involved in accident progression, dispersion of released pollutants in the atmosphere, environmental transport, exposure, health, and economic impacts. And though the Panel also recognized that this method was no longer state-of-the-art, the Panel contended that it represents a good example of a structured approach and methodology that could be built upon.
- The Panel also discussed TEQs used in epidemiological studies, based on intake, and recognized that the key uncertainty in what was measured was not just intake but also involved PK/PD issues. The Panel acknowledged that the TEQ system is regularly used on a concentration basis, but they expressed concern that the qualification becomes lost. TEQs ignore pharmacokinetics and the common practice of rounding to orders of magnitude introduces more error.
- Structure the risk assessment along MOA steps—identify key biochemical measures (~5–10) common across toxic endpoints and identify the degree of meaningful change in effect or effect variance. Make a table with all options for data set, model, etc.; make best estimates/choices and determine which of these choices matter the most to the answer.
- Use expert panels—expert judgment can be collected scientifically (procedures are published). But there are known biases; central tendency estimates work much better than extremes.
- Use supporting studies to fill in critical data gaps—Info filling methods do exist (e.g., PK modeling). Put short-term studies into the “supporting info” category (unless, of course, the risk assessment is for acute exposures, such as chemical spills).
- Be creative in the analysis of uncertainty. Intermediate steps between AhR binding and the end processes can be hypothesized based on data, experiences, and analogies related to other chemicals.
- The 2003 Reassessment presented potency estimates on wide variety of endpoints/models; needed to be more transparent in that discussion. Statistical graphics can be used to convey uncertainties.

APPENDIX A: 2009 U.S. EPA DIOXIN WORKSHOP AGENDA

SCIENTIFIC WORKSHOP TO INFORM THE TECHNICAL WORK PLAN FOR U.S. EPA'S RESPONSE TO NAS COMMENTS ON THE HEALTH EFFECTS OF DIOXIN PRESENTED IN U.S. EPA'S DIOXIN REASSESSMENT

Cincinnati, OH

Date: February 18–20, 2009

BACKGROUND/WORKSHOP OBJECTIVE

At the request of the U.S. Environmental Protection Agency (U.S. EPA), the National Academy of Sciences (NAS) prepared a report, *Health Risks from Dioxin and Related Compounds: Evaluation of the EPA Reassessment* (NAS, 2006), that made a number of recommendations to improve the U.S. EPA's risk assessment for 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD). In response, the U.S. EPA will prepare a technical report that addresses key comments on the dose-response assessment for TCDD. The U.S. EPA intends to develop its response through a transparent process that provides multiple opportunities for input.

To assist in this effort, a Workshop will be held to inform the U.S. EPA's evaluation of the NAS recommendations. The Workshop will be open to the public. At the Workshop, the U.S. EPA will solicit input from expert scientists and the public.

The goal of the Workshop is to ensure that the U.S. EPA's response to the NAS comments focuses on the key issues and reflects the most meaningful science. The three main objectives of the Workshop are to (1) identify and discuss the technical challenges involved in addressing the NAS key comments on the TCDD dose-response assessment in the U.S. EPA Reassessment (U.S. EPA, 2003), (2) discuss approaches for addressing these comments, and (3) identify key published, independently peer-reviewed literature, particularly studies describing epidemiologic and *in vivo* mammalian bioassays, which are expected to be most useful for informing the U.S. EPA response.

Workshop participants will be encouraged to think broadly about the body of scientific information that can be used to inform the U.S. EPA's response and to participate in open dialogue regarding ways in which the science can best be used to address the key dose-response issues. This Workshop is similar to scientific workshops being conducted under the new review process for the National Ambient Air Quality Standards (NAAQS)¹ that assess health-related information for criteria pollutants.

¹ Please see <http://www.epa.gov/ttn/naaqs/> for more information on the new NAAQS review process.

This document is a draft for review purposes only and does not constitute Agency policy.

The Workshop discussions are expected to build upon two prior publications:

1. *Exposure and Human Health Reassessment of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin (TCDD) and Related Compounds* (U.S. EPA, 2003). This external review draft provides a comprehensive reassessment of dioxin exposure and human health effects. This “dioxin reassessment” was submitted in October 2004 to the National Academy of Sciences (NAS) for review.
2. *Health Risks from Dioxin and Related Compounds: Evaluation of the EPA Reassessment* (NAS, 2006).

Workshop participants are encouraged to review both of these documents and other relevant materials (e.g., the National Toxicology Program report on TCDD [NTP, 2006]) before the meeting because they provide important insights into the key questions and challenges. There are a number of open comment periods that are intended to facilitate a broad discussion of the issues.

Scientists with significant expertise and experience relevant to the health effects of TCDD or dioxin-like compounds and associated topics will be asked to serve on “expert panels” for discussions throughout the Workshop. Workshop panelists will include a wide range of experts representing many scientific areas needed to assess TCDD dose-response (e.g., epidemiology, human and animal toxicology, nuclear receptor biology, dose-response modeling, risk assessment, and uncertainty analysis). The Workshop panelists will be asked to highlight significant and emerging research and to make recommendations to the U.S. EPA regarding the design and scope of the technical response to NAS comments on the dose-response analysis for TCDD—including, but not limited to, recommendations for evaluating associated uncertainty. Open comment periods will follow each panel discussion session. Public participation will be encouraged by way of these designated open comment periods and, also, by participation in the scientific poster session planned for the second evening (February 19).

U.S. EPA will use the input received during this Workshop as the foundation for its development of a technical work plan for responding to the NAS comments on the TCDD dose-response analysis. The work plan will outline the schedule, process, and approaches for evaluating the relevant scientific information and addressing the key issues. The work plan also will identify the key literature to be utilized in U.S. EPA’s response.

As a follow-on activity to this Workshop, a panel is being established under the Federal Advisory Committee Act (FACA) to guide and review the U.S. EPA’s response to NAS comments. The FACA panel will be asked to conduct a consultation with the Agency on the draft technical work plan. At the same time, the public will also have the opportunity to provide comments to the FACA panel on the work plan. The final technical work plan will guide the development of the technical report that will constitute the U.S. EPA’s response to NAS comments. During the development of this response, the U.S. EPA will seek advice from the FACA panel and the public several times. Finally, the FACA panel will be asked to review the technical report in a public forum.

The preliminary Agenda presented on the following pages may be revised prior to the Workshop following review by the session Co-Chairs; the dates and general timing of the

This document is a draft for review purposes only and does not constitute Agency policy.

sessions, however, will not change. A final Agenda and a set of charge questions, intended to provide general direction for the Workshop discussions, will be posted on the Workshop Internet site (<http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=199923>) prior to the meeting.

A poster session will be held on the evening of the second day (February 19). The purpose of this poster session is to provide a forum for scientists to present recent studies relevant to TCDD dose-response assessment and to encourage open discussion about these presentations.

WORKSHOP AGENDA

Day 1

8:00–9:00	Registration
9:00–9:30	Welcome/Purpose of Meeting/Document Development Process
9:30–9:45	Panel Comments/Questions on Charge
<u>9:45–2:45</u>	<u>Session 1: Quantitative Dose-Response Modeling Issues (Hall of Mirrors)</u>
9:45–10:10	Background/Introductory Remarks
10:10–10:35	TCDD Kinetics: Converting Administered Doses in Animals to Human Body Burdens Presenter: Michael Devito
10:35–11:30	Panel Discussion
11:30–1:00	Lunch
1:00–2:00	Panel Discussion cont.
2:00–2:45	Open Comment Period
2:45–3:05	Break
<u>3:05–5:15</u>	<u>Session 2: Immunotoxicity (Hall of Mirrors)</u>
3:05–3:15	Background/Introductory Remarks
3:15–4:45	Panel Discussion
4:45–5:15	Open Comment Period

This document is a draft for review purposes only and does not constitute Agency policy.

Day 2

<u>8:00–8:30</u>	<u>Report-Outs for Sessions 1 and 2 (Hall of Mirrors)</u>
8:00–8:15	Report-Out for 1: Quantitative Dose-Response Modeling Issues
8:15–8:30	Report-Out for 2: Immunotoxicity
<u>8:30–11:30</u>	<u>Sessions 3A and 3B (concurrent sessions)</u>
8:30–11:30	<u>Session 3A: Dose-Response for Neurotoxicity and Nonreproductive Endocrine Effects (Hall of Mirrors)</u>
8:30–8:45	Background/Introductory Remarks
8:45–11:00	Panel Discussion
11:00–11:30	Open Comment Period
8:30–11:30	<u>Session 3B: Dose-Response for Cardiovascular Toxicity and Hepatotoxicity (Rookwood Room)</u>
8:30–8:45	Background/Introductory Remarks
8:45–11:00	Panel Discussion
11:00–11:30	Open Comment Period
11:30–1:00	Lunch
<u>1:00–2:00</u>	<u>Report-Outs for Sessions 3A and 3B (Hall of Mirrors)</u>

The structure of the session report-outs will include the following:

- Summary of session presentation including minority opinion
- Public comments
- Discussion

1:00–1:15	Report-Out for 3A: Dose-Response for Neurotoxicity and Nonreproductive Endocrine Effects
1:15–1:30	Open Comment Period

This document is a draft for review purposes only and does not constitute Agency policy.

1:30–1:45 **Report-Out for 3B: Dose-Response for Cardiovascular Toxicity and Hepatotoxicity**

1:45–2:00 **Open Comment Period**

2:00–5:15 **Sessions 4A and 4B (concurrent sessions)**

2:00–5:15 **Session 4A: Dose-Response for Cancer (Hall of Mirrors)**

2:00–2:15 **Background/Introductory Remarks**

2:15–4:45 **Panel Discussion**

4:45–5:15 **Open Comment Period**

2:00–5:15 **Session 4B: Dose-Response for Reproductive/Developmental Toxicity (Rookwood Room)**

2:00–2:15 **Background/Introductory Remarks**

2:15–4:45 **Panel Discussion**

4:45–5:15 **Open Comment Period**

6:45–8:15 **Poster Session (Rosewood Room)**

Day 3

8:30–9:30 **Report-Outs for Sessions 4A and 4B (Hall of Mirrors)**

8:30–8:45 **Report-Out for 4A: Dose-Response for Cancer**

8:45–9:00 **Open Comment Period**

9:00–9:15 **Report-Out for 4B: Dose-Response for Reproductive/Developmental Toxicity**

9:15–9:30 **Open Comment Period**

This document is a draft for review purposes only and does not constitute Agency policy.

<u>9:30–3:30</u>	<u>Session 5: Quantitative Uncertainty Analysis of Dose-Response (Hall of Mirrors)</u>
9:30–9:40	Background/Introductory Remarks
9:40–10:10	Evidence of a Decline in Background Dioxin Exposures in Americans Between the 1990s and 2000s Presenter: Matt Lorber
10:10–10:30	Break
10:30–11:30	Panel Discussion
11:30–1:00	Lunch
1:00–2:15	Panel Discussion cont.
2:15–2:30	Break
2:30–3:00	Open Comment Period
3:00–3:15	Report-Out for 5: Quantitative Uncertainty Analysis of Dose-Response
3:15–3:30	Closing Remarks
3:30	Adjourn

This document is a draft for review purposes only and does not constitute Agency policy.

APPENDIX B: 2009 U.S. EPA DIOXIN WORKSHOP QUESTIONS TO GUIDE PANEL DISCUSSIONS

SESSION 1

Dose Metric

Considering all of the endpoints or target tissues, and species that U.S. Environmental Protection Agency (U.S. EPA)'s dose-response modeling might evaluate, what are the best measures of dose (e.g., ingested, tissue concentrations, body burden, receptor occupancy, other surrogate) and why?

Developing Dose-Response Models from Mammalian Bioassays

How best can the point of departure (POD) be determined when the response range is incompletely characterized (i.e., high response at the lowest dose or low response at the highest dose; observed in several key 2,3,7,8-Tetrachlorodibenzo-p-Dioxin [TCDD] studies)?

If considered to be biologically plausible, how can a threshold be incorporated into a dose-response function (e.g., for TCDD cancer data)?

How can nonmonotonic responses be incorporated into the dose-response function?

Developing Dose-Response Models from Epidemiological Studies

How can the epidemiological data be utilized best to inform the TCDD exposure-response modeling? Which epidemiological studies are most relevant?

Supporting Information

For those toxicological endpoints that are Ah receptor-mediated, how would the receptor kinetics influence the shape of the dose-response curve? How would downstream cellular events affect the shape of the dose-response curve? How can this cascade of cellular events be incorporated into a quantitative model of dose-response?

SESSIONS 2, 3A, 3B, 4A, AND 4B

Key Study Selection

For this endpoint, what refinements should be made to the draft criteria for selection of key studies?

What are the specific effects of concern for human health for this endpoint?

Based on the draft criteria for the selection of key studies, what are the key studies informing the shape of the dose-response curve above the POD and the choice of the POD for this endpoint?

Epidemiological Study Utility

How and to what extent do the epidemiological data inform the choice of critical effect?

How can the epidemiological data inform the quantitative dose-response modeling?

Animal Model Utility

Are there types of effects observed in animal models that are more relevant to humans than others? To what extent does information on mode of action (MOA) influence the choice of animal model (species, strain, sex)?

Supporting Information

Are there studies that establish a sufficient justification for departure from the default procedures that address the shape of the dose-response curve below the POD under the cancer guidelines?

Are there studies that establish a sufficient justification for departing from U.S. EPA's default approaches for noncancer endpoints?

To what extent can MOA information clarify the identification of endpoints of concern and dose-response metric for this endpoint? How can the cascade of cellular events for this endpoint be incorporated into a quantitative model of dose response?

SESSION 5

For cancer and noncancer TCDD dose-response assessments, U.S. EPA is interested in developing a quantitative uncertainty analysis addressing both parameter and model uncertainty, if feasible. Uncertainties will include, among others, choice of endpoint; underlying study uncertainties; choice of dose metric; interspecies extrapolations such as kinetic uncertainties; and choice of dose-response model, including threshold models. The U.S. EPA is currently examining techniques and tools for uncertainty analysis—including Bayesian and frequentist approaches.

Identification of Important Uncertainties

What are the major uncertainties pertaining to modeling the animal data?

Consider the dose metric (species or tissue specificity), vehicle of administration, exposure frequency, exposure duration, and POD determination (e.g., benchmark response selection or no-observed-adverse-effect level/lowest-observed-adverse-effect level identification).

What are the major uncertainties pertaining to dose-response modeling below the POD?

Consider how receptor kinetics and downstream cellular event information might be used to bound the uncertainties associated with dose-response modeling below the POD.

What are the major uncertainties in cross-species extrapolation (e.g., half-lives, tissue distribution, and toxicodynamics)?

Consider the primary species dosed with TCDD: mice, hamsters, rats, guinea pigs, and monkeys.

What are the major uncertainties pertaining to intrahuman variability?

Consider what data sets would be useful to represent sensitive subpopulations.

What are other significant sources of uncertainty for the cancer and noncancer assessments?

Considerations for Conducting Uncertainty Analysis

What data sets could be used to quantify uncertainties in cancer and noncancer TCDD dose-response assessments?

Consider dioxin-like compound dose-response data.
Consider MOA information.

What are the appropriate techniques for the TCDD dose-response uncertainty analysis, and what are their respective strengths and weaknesses of these approaches as applied to TCDD?

APPENDIX C: 2009 U.S. EPA DIOXIN WORKSHOP DRAFT SELECTION CRITERIA TO IDENTIFY KEY *IN VIVO* MAMMALIAN STUDIES THAT INFORM DOSE-RESPONSE MODELING FOR 2,3,7,8-TETRACHLORODIBENZO-*p*-DIOXIN (TCDD)^a

Study Feature	Selection Rationale		
	<i>Primary^b</i>	<i>Secondary^c</i>	<i>Currently Excluded</i>
Chemical, purity, matrix/medium	TCDD-only doses included, purity specified, matrix in which TCDD is administered is identified	TCDD purity or matrix not clearly identified	Studies of dioxin-like compounds (DLCs) or mixtures
Peer review	Independently peer-reviewed, publicly available	Supplementary materials accompanying peer-reviewed publication	Not formally peer-reviewed; literature not publicly available
Study design, execution, and reporting	Clearly documented and consistent with standard toxicological principles, testing protocols, and practice (i.e., endpoint-appropriate, particularly for negative findings)	Testing protocol provides incomplete coverage of relevant endpoint-specific measures, particularly for negative findings	Studies not meeting standard principles and practices
Study subject: species, strain, and sensitivity for given endpoint; litter; life stage; gender	Mammalian species Strain and gender identified Animal age at beginning of treatment identified Litter confounders (within/between) accounted for	Mammalian species, <i>in vivo</i> , but only studying an artificially sensitive subject (e.g., knockout mouse)	Non-mammalian or not <i>in vivo</i>
Exposure route	Oral	Parenteral (e.g., intravenous, intramuscular, intraperitoneal, subcutaneous)	Inhalation, dermal, ocular
Dose level	Lowest dose ≤200 ng/kg-d for noncancer endpoints and ≤1 µg/kg-d for cancer	Lowest dose >200 ng/kg-d for noncancer endpoints, or >1.0 µg/kg-d for cancer	
Exposure frequency, duration, and timing	Dosing regimen characterized and explained		Characterization/explanation missing or cannot be determined
Controls	Appropriate and well characterized	Effect reported, but with no negative control	
Response	Effect relevant to human health Magnitude outside range of normal variability	Precursor effects, or adaptive responses potentially relevant to human health	Lethality
Statistical evaluation	Clearly described and appropriate to the endpoint and study design (e.g., per error variance, magnitude of effect)	Limited statistical context	

^a NAS (2006) commented that the selection of data sets for quantitative dose-response modeling needed to be more transparent. These draft criteria are offered for consideration at the kickoff workshop. These criteria would be used to identify candidate studies of non-human mammals that would be used to define the point-of-departure (POD). These criteria are not designed for hazard identification or weight-of-evidence determinations. Studies addressing data other than direct TCDD dose-response in mammals (including toxicokinetic data on absorption, distribution, metabolism, or elimination; information on physiologically-based pharmacokinetic [PBPK] modeling, and mode of action data) will be evaluated separately.

^b Presents preliminary draft criteria for evaluating a study being considered for estimating a POD in a TCDD dose-response model.

^c Presents preliminary draft criteria that could qualify a study as primary with support from other lines of evidence (e.g., PBPK modeling), when no study for an endpoint meets the “primary” criteria.

**APPENDIX B. EVALUATION OF CANCER AND NONCANCER
EPIDEMIOLOGICAL STUDIES FOR INCLUSION IN TCDD
DOSE-RESPONSE ASSESSMENT**

B.1. EVALUATION OF CANCER STUDIES

B.1.1. NIOSH Cohort Studies

Table B-1. Fingerhut et al., 1991—All cancer sites, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The data sources to ascertain vital status and cause of death information were the Social Security death files, the National Death Index, and the Internal Revenue Service. Vital status could be determined for 98% of the cohort.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. While the authors provide compelling arguments that suggest risks are not unduly biased by lack of cigarette smoking data, they acknowledge potential biases that could exist for other occupational exposure (e.g., asbestos) for which data were lacking.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was not a statistically significant linear trend of increasing mortality with increased duration of exposure.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. This study used duration of exposure, at an individual level, as a surrogate measure of TCDD. Duration of exposure determined by number of years workers were involved in processes involving TCDD contamination. Exposure was determined by reviewing, at each plant, operating conditions, job duties, records of TCDD levels in industrial hygiene samples, intermediate reactants, products, and wastes. Exposure assessment was limited and the uncertainty related to exposure measures not fully addressed.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. This is the largest of the occupational cohorts that has been exposed to TCDD. The cohort consisted of 5,172 workers and a total of 265 cancer deaths. Site-specific mortality analyses, including soft tissue sarcoma ($n = 4$), was limited by small numbers.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria satisfied. New England Journal of Medicine, 1991; 324:212–218. Authors address the possibility of bias from lack of control for potential confounders such as smoking and other occupational exposures. They address limitations of using death certificates for identifying certain causes of deaths, and limitations of using duration of employment as an exposure metric.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Since this study used duration of exposure as the exposure metric, dose-response relationships cannot be quantified.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Models incorporated period of latency, and a surrogate measure of cumulative TCDD exposure was modeled. The follow-up interval was sufficiently long (1942–1987).
Conclusion	Overall, quantitative exposure data are lacking on an individual-level basis. Further dose-response analysis should consider updated data for this cohort that includes serum-based measures of TCDD, in addition to an extension of the follow-up period. Given these limitations, this study is not further evaluated for TCDD dose-response assessment.

5

Table B-2. Steenland et al., 1999—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The study evaluated mortality from all cancer sites (combined). As described in the paper, the sources of vital status and cause of death information were received from the Social Security death files, the National Death Index, and the Internal Revenue Service. Vital status was known for 99.4% of the cohort members, cause of death information is available for 98% of the decedents.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Occupational exposure to asbestos and 4-aminobiphenyl contributed to some excess cancer, but no evidence of confounding for the relationship between TCDD and all cancer mortality was detected following removal of workers who died of bladder cancer. No information is available for cigarette smoking, although dose-response patterns were stronger for nonsmoking related cancers. This finding suggests that smoking is not responsible for excess cancer risk that was observed in the cohort.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. When a 15-year lag interval was incorporated into the exposure metric a statistically significant dose-response pattern was observed for all cancer sites combined with both a continuous measure of TCDD ($p = 0.05$) as well as one that was log-transformed ($p < 0.001$).

This document is a draft for review purposes only and does not constitute Agency policy.

4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The study conducted detailed sensitivity analyses and evaluated different assumptions regarding latency, log-transformed TCDD exposures, and half-life values for TCDD.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. This is the largest of the occupational cohorts with exposures to TCDD. The cohort consisted of 5,132 male workers and a total of 377 cancer deaths. This permits characterization of risk for all cancer sites (combined).
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Journal of the National Cancer Institute, 1999; 91(9):779–786. The authors discussed the potential for bias from smoking, and other occupational exposures for which data for both were lacking at an individual basis.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Exposure scores assigned on an individual level using a job-exposure matrix. The job-exposure matrix was based on estimated factor of contact with TCDD in each job, level of TCCD contamination of materials at each plant over time, and proportion of day worker could be in contact with materials. These factors were multiplied together to derive a daily exposure score, which was accumulated over the working history of each worker to obtain a cumulative measure of TCDD.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. The follow-up of the cohort extended from 1942 until the end of 1993. Greater than 25 years of follow-up have accrued in cohort allowing for latency to be examined. Different assumptions on the half-life of TCDD were evaluated and produced similar results. Latency intervals were incorporated, with strongest associations noted with an interval of 15 years.
<hr/>	
Conclusion	This study meets the criteria and considerations noted above but has been superseded and updated by Steenland et al. (2001). Therefore, this study was considered for further dose-response analyses.

Table B-3. Steenland et al., 2001—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The study evaluated mortality from all cancer sites (combined). As described by Steenland et al., (1999) the sources of vital status and cause of death information were received from the Social Security death files, the National Death Index, and the Internal Revenue Service. Vital status was known for 99.4% of the cohort members, cause of death information is available for 98% of the decedents.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Occupational exposure to asbestos and 4-aminobiphenyl contributed to some excess cancer, but no evidence of confounding for the relationship between TCDD and all cancer mortality was detected following removal of workers who died of bladder cancer. No information is available for cigarette smoking, although dose-response patterns were similar between smoking and nonsmoking related cancers.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Increased risk estimates were observed in the higher cumulative exposure categories. The dose-response curve was not linear at higher doses.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Exposure metrics considered included cumulative TCDD, log ₁₀ TCDD, average exposure, and a cubic spline model was also evaluated. Exposure response relationships were also evaluated using TEQs. Exposure scores were assigned on an individual level using a job-exposure matrix. The job-exposure matrix was based on estimated factor of contact with TCDD in each job, level of TCCD contamination of materials at each plant over time, and proportion of day worker could be in contact with materials. Serum levels were measured in 199 workers at one of 8 plants in 1998. Different estimate of the half-life of TCDD were used, and similar results were produced. The paper presented a range in risk estimates thereby conveying the range of uncertainties in risk estimates derived using different measures of exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. This is the largest of the occupational cohorts with exposures to TCDD. The cohort consisted of 3,538 male workers and a total of 256 cancer deaths.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied Am J Epidem, 2001, 154(5):451–458. However, additional details to assess uncertainties associated with characterizing serum data in a subset of workers to remainder of cohort are lacking.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria satisfied. The metrics considered included cumulative TCDD, log10TCDD, average exposure, and a cubic spline model was also evaluated. Exposure response relationships were also evaluated using TEQs. Serum lipid TCDD measurements from 170 workers whose TCDD levels were greater than 10 ppt (the upper ranges of a background level) were used along with JEM information, work histories, and a pharmacokinetic elimination model to estimate dose rates per unit exposure score. In this regression model, the estimated TCDD level at the time of last exposure was modeled as a function of exposure scores. The coefficient relating serum levels and exposure scores was then used to estimate serum TCDD levels over time from occupational exposure (minus the background level) for all 3,538 workers. Time-specific serum levels were then integrated over time to derive a cumulative serum lipid concentration due to occupational exposure for each worker.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Greater than 25 years of follow-up have accrued in cohort allowing for latency to be examined. Different assumptions on the half-life of TCDD were evaluated producing similar results.
Conclusion	Overall, criterion has been satisfied and it is recommended that this study be considered for dose-response analysis.

2
3
4

Table B-4. Cheng et al., 2006—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The study evaluated cancer mortality. The vital status and the information regarding the cause of death were extracted from the Social Security death files, the National Death Index, and the Internal Revenue Service (Steenland et al., 1999). Vital status was known for 99.4% of the cohort members, while cause of death information is available for 98% of the decedents.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. This is the same data set used in the Steenland et al., (2001) paper. Occupational exposure to asbestos and 4-aminobiphenyl contributed to some excess cancer, but no evidence of confounding for the relationship between TCDD and all cancer mortality was detected following removal of workers who died of bladder cancer. No information is available for cigarette smoking, although dose-response patterns were similar between smoking and nonsmoking related cancers.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Slope coefficients are available for all cancers combined under a varying set of assumptions. Little evidence of an association was found when lag interval was not taken into account. Associations strengthened with incorporation of a 10 to 15 year lag interval. Dose-response was nonlinear at higher exposures, suggesting a nonlinear relationship or increased exposure misclassification at higher levels.

This document is a draft for review purposes only and does not constitute Agency policy.

4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Compared to the 1 st order models, the concentration, and age dependent model (CADM) provided a better fit for the serum sampling data. CADM model exposure estimates are higher than those based on an age only, constant 8.7-year half-life model. As discussed by Aylward et al. (2005b), model exposure estimates are influenced not only by choice of elimination model, but also by choices in regression procedure (e.g., log transformation, use of intercept, and incorporation of background dose term). Other limitations or uncertainties in exposure assessment include the following <ul style="list-style-type: none"> • Job-exposure matrix based on limited sampling data, and subjective judgment on contact times and factors • Inability to take into account inter-individual variability in TCDD elimination kinetics • Dose-rate regressions are based on a small sample of the cohort with serum measures; therefore, regression results may not be representative of remainder of the cohort.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Largest cohort of TCDD exposed workers. The risk estimates are based on a total of 256 cancer deaths.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Risk Analysis, 2006; 4:1059–1071. Additional details to assess uncertainties associated with characterizing serum data can be found in Aylward et al. (2005b); Risk Anal. 25(4):945–956.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Cumulative serum lipid concentrations were estimated for each worker. No other dioxin-like compounds were assessed in this analysis.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Concentration and age-dependence of TCDD elimination and two compartments (hepatic and adipose tissue) were taken into account when estimating TCDD exposures. Nearly 50 years of follow-up were available permitting an evaluation of latency.
Conclusion	This study met the main criteria and considerations. These data were considered for further dose-response analyses.

1
2
3
4
5

Table B-5. Collins et al., 2009—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Vital status complete for all but two workers.

2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. No information collected on smoking status, but no excess in lung cancer or nonmalignant respiratory diseases noted. Analyses took into account potential for exposure to pentachlorophenol.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. No dose-response pattern was observed with all cancer sites combined, however, a dose-response pattern was observed with soft tissue sarcoma. The study found no association between TCDD and death from most types of cancer.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The authors used these serum from 280 former TCP workers to estimate historical exposure levels of TCDD, furans, and polychlorinated biphenyls for all 1,615 workers. Exposure assessment included detailed work history, industrial hygiene monitoring, and the presence of chloracne cases among groups of workers. This data was integrated into a 1-compartment, first-order pharmacokinetic to determine the average TCDD dose associated with jobs in each group, after accounting for the presence of background exposures estimated from the residual serum TCDD concentration in the sampled individuals. The authors did not evaluate departures from linearity, or examine skewness at higher exposures. Exposure levels were not provided.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Largest study of workers employed in one center, and a total of 177 deaths from cancer were observed. Limited precision for soft tissue sarcomas for which a positive association has been demonstrated.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in Am J Epidemiol, 2009, 170(4):501–506. The authors discuss limitations of using death certificates for identifying deaths from soft tissue sarcoma for which a positive association was noted, assumptions in exposure characterization, and effects of cigarette smoking.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. This study has the largest number of serum samples obtained from a specific plant.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. While the cohort did have sufficient follow-up, no evaluation of possible latent effects was presented.
<hr/>	

This document is a draft for review purposes only and does not constitute Agency policy.

Conclusion	Study is not suitable for further evaluation or dose-response modeling since an exposure-response relationship was not demonstrated. The evaluation of exposure metrics and latency considerations should be expanded beyond that presented in the paper. Previous analyses of these same workers found positive associations between cancer mortality and TCDD (Steenland et al., 2001). The reasons for the discrepancy in the findings from the two papers may be due to Steenland et al.'s use of nonlinear exposure metrics, incorporation of a 15-year lag interval, or differences in the TCDD exposure estimates themselves.

B.1.2. BASF Cohort Studies

Table B-6. Zober et al., 1990—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. A large component of the cohort (94 out of 247 workers) was assembled by actively seeking out workers who were alive in 1986 through the “Dioxin Investigation Programme.” As a result, it is likely a number of deaths were missed due to the recruitment of survivors. This underascertainment is supported by much lower all cancer SMR one component of the cohort (SMR = 0.48, 95% CI: 0.13–1.23) relative to the general population.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. See above discussion of underascertainment in mortality for some of the cohort members. Although it is likely that other co-exposures occurred (e.g., among firefighters), confounding could only occur if these co-exposures were associated with both the endpoint and exposure (TCDD) being considered.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. Workers were not categorized on the basis of their exposure, but rather their mortality experience compared to control cohort and the general population. The design of the study does not allow for dose-response to be examined.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Although years since first exposure was examined, exposure assessment was based on working in various occupational cohorts. Since there was no quantitative assignment of TCDD exposures, the associated uncertainties could not be evaluated.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration not satisfied. There were only 23 cancer deaths in the entire cohort. As such, this study lacked adequate statistical power to detect cancer mortality differences that were moderate in magnitude.

This document is a draft for review purposes only and does not constitute Agency policy.

1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Int Arch Occup Environ Health, 1990, 62:139–157. The authors address issues related to the healthy worker effect, multiple comparisons, smoking, and small size of the cohort.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Risks were derived by comparing mortality rates of the three cohort subsets relative to a control cohort and the general population by time since first exposure categories. Workers were not assigned exposures. There were no quantitative estimates of TCDD exposure.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. While the study was able to indirectly look at variations in risk estimates related to latency by using time since exposure, there were no quantitative estimates of TCDD exposure.
Conclusion	This study is not suitable for dose-response analysis, as it failed the inclusion criteria. Most notably, the lack of exposure data does not permit the use of these data for a dose-response analysis.

1
2
3
4

Table B-7. Ott and Zober, 1996—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality ascertainment appeared to be fairly complete. The ascertainment of cancer incidence is more difficult to judge as geographical area not covered by a cancer registry.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Information was collected on smoking status, body mass index, and other occupational exposures, however a large portion of the cohort was firefighters who may have been exposed to other occupational carcinogens. However, the recruitment of survivors may result in under-ascertainment of mortality.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Increased cancer incidence was observed in the highest TCDD cumulative exposure category. Risks were most pronounced when a period of 20 years since first exposure was incorporated into the model.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. Cumulative measure of TCDD expressed was derived from serum measures. Exposure was also estimated by chloracne status of the cohort members. The authors have not addressed the potential implication of deriving TCDD exposure estimates for the whole cohort using sera data that were available for only about half of the cohort.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 31 deaths. It is the smallest of the occupational cohorts, but the deaths can be grouped into quartiles to allow for evaluation of dose-response relationships.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Occupational and Environmental Medicine, 1996, 53:606–612. A large component of the cohort (94 out of 247 workers) was assembled by actively seeking out workers who were alive in 1986 through the “Dioxin Investigation Programme.” As a result, it is likely a number of deaths were missed due to the recruitment of survivors. This underascertainment is supported by much lower all cancer SMR one component of the cohort (SMR = 0.48, 95% CI: 0.13–1.23) relative to the general population (Zober et al., 1990).
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum samples, taken in 1989, were available for 138 surviving workers out of 254 and allowed for cumulative TCDD levels to be estimated using regression techniques in the remainder of the cohort.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Exposure assignment took into the affect that body mass index had on TCDD half-lives. TCDD levels estimates through back-extrapolation of serum levels based on half-life estimates obtained from previous studies. Latency was considered with stronger association observed in external comparisons incorporating a latency of 20 years. The follow-up of the cohort was lengthy (>50 years).
<hr/>	
Conclusion	Given a part of the cohort was based solely on survivors in the in the mid-1980s, the SMR statistic derived from this study underestimates excess mortality relative to the general population. The cohort also includes a fair number of firefighters who are recognized to be exposed to other carcinogenic agents—these exposures may be confounding the associations that were reported. However, exposure to TCDD was quantified and the effective dose and oral exposure estimable. Therefore, quantitative dose-response analyses were considered for these data.

7

1 **B.1.3. The Hamburg Cohort**

2
3
4
5

Table B-8. Manz et al., 1991—All cancer sites combined, site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Deaths were identified through medical records of the cohort members. A review of death certificates of the identified cancer deaths found a high degree of concordance (51/54). One of the 136 noncancer death certificates examined indicated an “occult” neoplasm.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Smoking data were similar between exposed and nonexposed cohort based on independent samples. Occupational exposure for which individual data are lacking unlikely to explain dose-response with TCDD.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Dose-response patterns across three levels of exposure observed among those who started work before 1954, and among those who worked for 20 years or longer. Dose-response patterns not evident across whole cohort, among those with less than 20 years of employment, or among those who started after 1954.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Categorical exposures were based on TCDD concentrations in precursor materials, products, waste, and soil from the plant grounds, measured after the plant closed in 1984. Exposure uncertainty examined using a separate group of 48 workers who provided adipose tissue samples. Other surrogate measures of exposure were considered in this study, including duration of exposure and year of first employment.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 65 cancer deaths for the comparison to the comparison cohort of gas workers. The study is underpowered to look at site-specific cancers.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. <i>Lancet</i> , 1991, 338:959–964. The authors discussed potential for misclassification using death certificates, healthy worker effect and their related use of a comparison cohort of gas supply workers, other occupational exposures present at the plant, potential impact and the lack of smoking data.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Exposure consisted of a large DLC component that was not quantified. Given crude TCDD exposure categorization data, no quantitative exposure metric was derived.

This document is a draft for review purposes only and does not constitute Agency policy.

3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Exposure metrics were constructed that took into account duration of exposure, and periods when exposure was highest. However, exposure estimates did not consider lagged exposure.
Conclusion	This study is not amenable to further TCDD dose-response analysis because it consisted of a large DLC component that was quantified and no quantitative exposure metric was derived. The dose-response patterns of risks observed across the three exposure groups provide compelling support for an association between TCDD and cancer mortality, particularly, given the associations observed when analyses restricted to those who were hired when TCDD exposures were known to be much higher, and among those who worked for at least 20 years. Subsequent studies improved the exposure assessment through the use of serum measures.

5

Table B-9. Flesch-Janys et al., 1995; Flesch-Janys et al., 1996 erratum—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Medical records used to identify deaths over the period 1952–1992.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Similarity in smoking rates between control cohort and the exposed workers was similar based on independent surveys. Occupational exposures to benzene, and dimethyl sulfate were unlikely to bias dose-response pattern observed as these exposures occurred in production departments with low-medium levels of exposure.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Dose-response relationship observed across 6 exposure categories, with the cohort of gas supply workers used as the referent.
4. Consideration	Consideration satisfied. Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	The exposure measure was an integrated TCDD concentration over time estimate that back-calculated TCDD exposures to the end of the employment. Categorical and continuous TCDD exposures were examined in relation to the health outcome. These efforts improve the exposure assessment of earlier studies.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 124 deaths in the exposed cohort, and 283 in the cohort of gas supply workers. No site-specific cancers were examined in this paper.

This document is a draft for review purposes only and does not constitute Agency policy.

1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 1995, 144:1165–1175. The authors discuss the potential role of other occupational exposures (i.e., dimethyl sulfate, solvents, and benzene), smoking, and suitability of the comparison cohort of gas supply workers.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum and adipose tissues were used to estimate TCDD exposure in 190 workers. A one-compartment first-order kinetic model was used to estimate exposure at end of exposure for these workers. Regression methods were then used to estimate TCDD exposures for all workers.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. Exposure was based on half-life estimates from individuals with repeated serum measures. Other dioxin-like compounds were considered with the TOTTEQ exposure metric. No consideration, however, was given to latency or lagged exposures.
Conclusion	The exposure data used within this study are well-suited to a dose-response analysis given the associations observed, the characterization of exposure using serum, and quality of ascertainment of cancer outcomes. However, subsequent methods have been applied to the cohort to derive different exposures to TCDD using area under the curve approaches, which updates the analysis herein. Therefore, subsequent studies (i.e., Becher et al., 1998) will supersede this evaluation.

1
2
3
4
5

Table B-10. Flesch-Janys et al., 1998—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality follow-up was extended until the end of 1992, an increase in 3 years from previous analyses of the cohort.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Exposure was well characterized using sera data. While serum samples provided only from a subsample of surviving workers, these levels were consistent with expected levels in different production departments. The authors examined other potential occupational co-exposures (e.g., β -hexachlorocyclohexane) and indirectly examined the potential effect of smoking on the associations that were detected.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. A dose-response relationship across quartiles of TCDD was observed with cancer mortality based on the SMR statistic (SMRs = 1.24, 1.34, 1.34, 1.73), and a linear test for trend was statistically significant ($p = 0.01$).

This document is a draft for review purposes only and does not constitute Agency policy.

4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The exposure measure was an integrated TCDD concentration over time estimate that back-calculated TCDD exposures to the end of the employment. Categorical and continuous TCDD exposures were examined in relation to the health outcome. These efforts improve the exposure assessment of earlier studies.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 124 cancer deaths.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 1998, 106(2):655–662. The authors address uncertainties in the estimation of exposure, describe the potential for confounding from β -2,4,5-T, hexachlorocyclohexane, and cigarette smoking. In fact, they showed that blood levels of TCDD were not associated with smoking in a sub-sample suggesting little bias from lack of smoking data.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum samples, taken from 190 workers were used to derive TCDD levels for the entire cohort. Methods used to estimate exposure took into account elimination of TCDD during employment periods when exposure took place, and the methods of the area under the curve was used as it takes into account variations in concentration over time, and reflects cumulative exposure.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Exposure estimated based on half-lives observed in individuals with repeated samples. Area under the curve approach was used which is an improvement from past characterizations of exposure in this cohort.
Conclusion	The study provides data suitable for dose-response modeling. Derivation of exposure was done using current understanding of elimination of TCDD. Estimates of risks were derived from external comparisons to the general population that are unlikely to be biased by healthy worker effect, but risks generated using internal cohort comparisons would be preferable. Becher et al., (1998) assessed this same data taking cancer latency into account, therefore Flesch-Janys et al., (1998) will not be further considered for dose-response modeling.

1
2
3
4

Table B-11. Becher et al., 1998—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Medical records used to identify deaths over the period 1952–1992. The follow-up interval was lengthy.

2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Risks adjusted for exposures to TEQ, β -hexachlorbenzene, and employment characteristics. Smoking was shown to be similar to the comparison cohort of gas workers.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. A variety of exposure measures for both TCDD and TEQs found positive associations with cancer mortality.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The exposure measure was an integrated TCDD concentration over time estimate that back-calculated TCDD exposures to the end of the employment. Categorical and continuous TCDD exposures were examined in relation to the health outcome. Different models explored the shape of the dose-response curve. These efforts improve the exposure assessment of earlier studies.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 124 cancer deaths.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 1998, 106(2):663–670. The authors discuss uncertainties associated with their use of exposure metrics, inability to evaluate effects for PCDD/Fs other than dioxin due to high correlations with β -HCH, and inability to characterize risks associated with exposures in children.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. The authors derived a measure of cumulative dose as a time-dependent variable (“area under curve”) using serum measures available in a sample of 275 workers.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. TCDD levels estimates through back-extrapolation of serum levels based on half-life estimates obtained from previous studies. Latency was considered, and a variety of exposure metrics including nonlinear relationships were evaluated.
<hr/>	
Conclusion	In this paper, a variety of exposure metrics were found to be positively associated with cancer mortality. The additional lifetime risk of cancer corresponded to a daily intake of 1pg ranged between .01 and 0.001. This study was modeled in the 2003 Reassessment and is considered for further dose-response evaluations herein.

This document is a draft for review purposes only and does not constitute Agency policy.

Table B-12. Bertazzi et al., 2001—All cancer sites combined, site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality appears to be well captured from the vital statistics registries in the region (99% complete). Vital status was ascertained using similar methods for both the exposed and reference populations. Both cancer and noncancer mortality outcomes were evaluated. Ideally, would have evaluated incident rather than decedent outcomes for cancer.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Individual-level data on potential confounders (i.e., age, calendar period, and gender) were adjusted for. Information from other independent surveys suggests similarity between smoking behaviors across the regions. Comparison of cancer mortality rates before the time of the accident between the regions also revealed no differences.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied (for all cancers combined). No statistically significant excesses noted in Zone A, or Zone B relative to reference area. Evidence of an exposure-response relationship was detected for lymphatic and hematopoietic tissues by number of years since first exposure.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Subjects were assigned to one of the zones (A, B, R, or reference) based on official residence on the day of the accident or at entry into the area. Exposure misclassification is likely and lack of individual-level data precludes an examination of this source of error.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. In total, 27, and 222, cancer deaths were found among residents of Zones A, and B, respectively. This allowed examined of gender-specific effects.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2001 Jun 1; 153(11):1031–1044. Authors discuss completeness of mortality ascertainment, diagnostic accuracy of death certificates particularly with respect to diabetes, limited available of blood dioxin measures that did not permit estimation of TCDD dose on an individual-level basis.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. Individual-level exposure data are unavailable. Exposure based on place of residence at time of the explosion. Soil sampling performed indicated considerable variability in TCDD levels within each region. In addition, place of residency at time of explosion does not ensure individuals were at their home around the time of the accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. An ecological measure of exposure (region of residency at time of accident) was used to categorize individuals according to their possible exposure. Latencies were considered. While such an approach has value for identifying wherever excesses occurred among highly exposed populations, it is not precise enough to conduct a quantitative dose-response analysis.
Conclusion	The lack of individual-level exposure data precludes quantitative dose-response modeling using these data.

Table B-13. Pesatori et al., 2003—All cancer sites combined, site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality appears to be well captured from the vital statistics registries in the region (99% complete).
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Individual-level data on potential confounders (i.e., age, calendar period, and gender) were adjusted for.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. While excesses of mortality were observed for several health conditions in Zone A, a dose-response pattern was not observed across Zones A, B and R. Among men, excess mortality observed in zone A included chronic ischemic disease, and chronic obstructive pulmonary diseases. Among females, an excess in Zone A was observed with hypertension.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Subjects were assigned to one of the zones (A, B, R, or reference) based on official residence on the day of the accident or at entry into the area. Exposure misclassification is likely and lack of individual-level data precludes an examination of this source of error.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. Only 39 deaths observed among men in Zone A; 39 deaths observed among their female counterparts. Among females, only 3 deaths from hypertension observed in Zone A, and only 4 deaths observed among males for chronic obstructive pulmonary disease.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. <i>Occup Env Med</i> , 1998; 55:126–131. Authors discuss limitations such as residency-based exposure assignment, absence of smoking, differential and death certification in exposed versus nonexposed areas.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Individual-level exposure data are unavailable. Exposure based on place of residence at time of the explosion. Soil sampling performed indicated considerable variability in TCDD levels within each region. In addition, place of residency at time of explosion does not ensure individuals were at their home around the time of the accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. An ecological measure of exposure (region of residency at time of accident) was used to categorize individuals according to their possible exposure. Latencies were considered. While such an approach has value for identifying wherever excesses occurred among highly exposed populations, it is not precise enough to conduct a quantitative dose-response analysis.
Conclusion	No dose-response patterns evident in the study, and the study lacked quantifiable measures of TCDD at an individual-level basis. The data are not well suited for dose-response analysis.

1

3
4
5

Table B-14. Consonni et al., 2008—All cancer sites combined, site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality appears to be well captured from the vital statistics registries in the region (99% complete. Both cancer and noncancer mortality evaluated), although diagnostic accuracy of death certificates is likely low. Ideally, would have evaluated incident rather than decedent outcomes for cancer.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Individual-level data on potential confounders (i.e., age, calendar period, and gender) were adjusted for. Comparison of cancer mortality rates before the time of the accident between the regions also revealed no differences. Information from other independent surveys suggests similarity between smoking behaviors across the regions.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied for some outcomes. For all cancer sites combined, no evidence of dose-response was observed relative to general population across Zones A, B and R. Only statistically significant excess found in Zone A was for chronic rheumatic disease but based on only three deaths. Higher cancer excesses were found in Zone A after a latency period was incorporated; however, no dose-response relationship observed with this latency period. Evidence of an exposure-response relationship was detected for lymphatic and hematopoietic tissues by zone of residence.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Subjects were assigned to one of the zones (A, B, R, or reference) based on official residence on the day of the accident or at entry into the area. Exposure misclassification is likely and lack of individual-level data precludes an examination of this source of error.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. In total, 42, 244, and 1,848 cancer deaths were found among residents of Zones A, B, and R respectively.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2008, 167:847–858. Authors discuss potential for selection bias, limitation of residential based measure of exposure, similarities of mortality ascertainment in exposed and referent populations, and multiple testing.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Individual-level exposure data are unavailable. Exposure based on place of residence at time of the explosion. Soil sampling performed indicated considerable variability in TCDD levels within each region. In addition, place of residency at time of explosion does not ensure individuals were at their home around the time of the accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. An ecological measure of exposure (region of residency at time of accident) was used to categorize individuals according to their possible exposure. Latencies were considered. While such an approach has value for identifying wherever excesses occurred among highly exposed populations, it is not precise enough to conduct a quantitative dose-response analysis.
Conclusion	The lack of individual-level exposure data precludes quantitative dose-response modeling using these data.

1
2
3
4

Table B-15. Baccarelli et al., 2006—Site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
------------------	---

Response	Consideration satisfied. Polymerase chain reaction (PCR) methods were used to describe outcome measures. The prevalence of t(14; 18) was estimated as those individuals having a t(14; 18) positive blood sample divided by the t(14; 18) frequency (number of copies per million lymphocytes).
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Questionnaire data were used to collect information on cigarette smoking. Other potential confounders (age, smoking status, and duration of smoking). In addition, both exposure and outcome were objectively and accurately measured.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration was not satisfied. Associations were detected between the frequency of t(14; 18) and plasma TCDD levels as well as zone of residence at the time of the explosion. No association was detected for these exposure measures and prevalence of t(14; 18). A dose-response trend was detected for TCDD and the mean number of t(14;18) translocations/10 ⁶ lymphocytes, however the relevance of t(14; 18) in lymphocytes to Non-Hodgkin's lymphoma is uncertain.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The authors highlight that exposure metrics represent both past and current body burdens. They employ several different exposure metrics of TCDD: place of residence (Zone A, B, R or reference), categorical serum measures, a linear term, log (base 10) transformed TCDD, and individuals with chloracne diagnosed after the accident.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Analyses are made using 72 highly exposed, and 72 low exposed individuals.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Carcinogenesis, 2006, 27(10):2001–2007. The authors discuss the limitation of using t(14; 18) translocations as an outcome measure, and the uncertain role it plays in the development of non-Hodgkin's lymphoma.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. A total of 144 subjects were included in the study. This included 72 subjects who had low exposures, and 72 who had high exposures based on serum concentrations.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. A variety of measures were employed including current TCDD levels, as well as surrogates of exposure at the time of the accident.

This document is a draft for review purposes only and does not constitute Agency policy.

Conclusion	While an association was observed with the frequency of t(14; 18) translocation, it is uncertain whether this translates into an increased risk of non-Hodgkin’s lymphoma. Given the speculative nature of this endpoint and lack of demonstrated adverse effect, dose-response analyses for this outcome were not conducted.
------------	---

4

Table B-16. Warner et al., 2002—Breast cancer incidence

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Diagnoses of incident breast cancer were based on interview and information from medical records appears thorough. Of the 15 cases of breast cancer, 13 were confirmed by pathology and the remaining 2 by surgery report only. Three cases of breast cancer were excluded which represents a large proportion of the total cases identified. This would reduce sample size and could result in bias if the exclusion was association with TCDD exposure.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Information was collected on an extensive series of risk factors by using an interviewer administered questionnaire. Participation rates for the survey were fairly good (80%).
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Limited evidence (not statistically significant) of a dose-response when TCDD was analyzed as a categorical variable; only one breast cancer case was in the referent exposure category. In the analysis of TCDD as a continuous measure (\log_{10} TCDD), the hazard ratio associated with a 10-fold increase in TCDD serum levels was 2.1 (95% CI: 1.0–4.6).
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Different exposure metrics were considered in these analyses (categorical, continuous, measures on a log-scale). Exposure data are of high quality as they are based on serum samples taken among women near the time of the accident. As such, exposure assignment is not dependent on as many assumption as used in occupational cohorts were back-extrapolation for many years had to be performed.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration somewhat satisfied. Inadequate follow-up for cancer limited the number of cases available. Sample size also limited the conclusions draw from the categorical analysis based on very few cases for some exposure categories.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Paper published in Environ Health Perspect, 2002 Jul, 110(7):625–628. . A major limitation of the study is the small number of incident cases of breast cancer (n = 15), discussed important strengths of the study including characterization of TCDD using serum collected near the time of the accident.

This document is a draft for review purposes only and does not constitute Agency policy.

2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum was used to estimate TCDD levels in 981 of 1271 eligible women who had lived in either of the two contaminated sites in 1976. Data represent an objective measure of TCDD near the time of the exposure. Data obtained near the time of exposure which minimized the potential for exposure misclassification.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Exposure characterized using serum measures obtained close to the time of the accident.
Conclusion	While characterization of exposure and availability of other risk factor data at an individual-level basis are important strengths of this study, small sample size (n = 15 cases) based on inadequate follow-up is a key limitation. Quantitative dose-response analyses were conducted using this study, but continued follow-up of the study population or consideration of all cancer outcomes would be valuable.

B.1.5. The Chapaevsk Study

Table B-17. Revich et al., 2001—All cancer sites combined, and site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration cannot be evaluated. Insufficient details are provided in the paper to gauge the completeness and coverage of the cancer registry and mortality data. Health outcomes were studied on the basis of information in the official medical statistics.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Given that this is an ecological study, bias may be present.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration cannot be evaluated. Dose-response was not evaluated as exposure was based on residency in the region vs. no residency.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. No individual-level exposure estimates were used.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 476 cancer deaths were observed among males, and 376 cancer deaths observed among females. The precision of the SMRs is demonstrated with fairly narrow confidence intervals for many causes of death.

This document is a draft for review purposes only and does not constitute Agency policy.

1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria not satisfied. Published in Chemosphere, 2001, 43(4-7):951-966. Authors do not address the completeness of the mortality follow-up, and whether there are differences in death registrations between regions. The authors do acknowledge, however, that new investigations being undertaken would characterize exposure using serum-based measures.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. It is a cross-sectional study that compares mortality rates between regions. No individual-level exposure data available.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. No individual-level exposure estimates were used in the study.
Conclusion	These cancer data are cross-sectional in nature and not appropriate for a dose-response analysis.

7

B.1.6. The Air Force Health (“Ranch Hands”) Study

Table B-18. Akhtar et al., 2004—All cancer sites combined and site-specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Cancer incidence and mortality based on information from repeated medical examinations, medical records and death certificate.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. The risk estimates were adjusted for a number of factors measured on an individual level including smoking. However, analyses are unable to distinguish between exposure to TCDD and 2,4-D as both were used in equal parts in the formulation of Agent Orange.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. There is evidence of a dose-response for all cancers and for some site-specific cancers (i.e., malignant melanoma, and prostate cancer).
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. High quality exposure data for most veterans was collected, so extrapolation to other members of the cohort was not required. The serum dioxin measurements also correlated well with reported skin exposure to herbicide in Vietnam, but collection of the samples 25 years later required back-extrapolation.

This document is a draft for review purposes only and does not constitute Agency policy.

5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. In total, 117 incidence cancers identified in the Ranch Hands cohort. For those sites with a dose-response association, malignant melanoma and prostate cancer, there were 16 and 34 incident cases, respectively.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in J Occup Environ Med, 2004, 46(2):123–136. Authors highlight that this is only cancer incidence study in US veterans, and the lengthy interval of follow-up (35–40 years)—both important strengths of the study. They addressed potential bias from healthy-worker effect, and uncertainties surrounding the estimation of TCDD exposure (extrapolation 30 years after exposure), as well as exposure to other chemical exposures. Study uses incident outcomes for cancer.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Individual exposure estimates are based on measurements of dioxin serum lipid concentrations. They were available for 1,009 Ranch Hands and 1,429 in the comparison cohort.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. TCDD exposures at the end of duty were estimated by back-extrapolating 1987 serum values.
Conclusion	The major limitation of the study is the inability to isolate effects of TCDD from other chemicals used in the formulation of the herbicides. This limitation precludes dose-response modeling of the TCDD and cancer outcomes data.

1
2
3
4

Table B-19. Michalek and Pavuk, 2008—All cancer sites combined

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Cancer incidence was ascertained through the use of medical records. Death certificate were used to identify some malignancies. Little data is provided on the number of individuals lost to follow-up, however the same mechanisms of case ascertainment were applied to both the comparison and Ranch Hand cohorts.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Information collected from repeated physical examinations allowed for the adjustment of risk factors such as smoking. Agent Orange was a 50% mixture of 2,4-D and TCDD; therefore, potential for confounding by other coexposures is likely.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied for some comparisons. Statistically significant associations were noted with cancer incidence and TCDD when analyses were restricted to workers who served at most two years in Southeast Asia and those who sprayed more than 30 days before 1967.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Initial TCDD dose were estimated at the end of the tour of duty for the Ranch Hands. Individual-level serum dioxin measurements correlated well with correlated with days of spraying and calendar period of service, but collection of the samples roughly 20 years later required back-extrapolation.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 347 incident cases of cancer were used in the analyses. For stratified analyses, statistical power is more limited. For example, only 67 incident cancer in the subset of workers who spent less than 2 years in Southeast Asia, and sprayed for at least 30 days before 1967.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied J Occup Environ Med 2008; 50:330–340. The authors discuss issues related to exposure misclassification error, and suggest approaches for improving characterization of days of spraying. Congener specific data were unavailable, thereby not allowing for congener specific risks or adjustments to be made.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. TCDD data was available for 986 veterans in the Ranch Hand cohort, and 1,597 members of the comparison cohort.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. TCDD exposures at the end of duty were estimated by back-extrapolating 1987 serum values.
<hr/>	
Conclusion	Ranch Hand veterans were exposed to other contaminants in the herbicides that were mixed, thereby making it difficult to determine independent effects of TCDD on cancer. In particular, 2,4-D has been shown to be associated with some cancers, notable cancer of the prostate. In our view, this limitation precludes dose-response modeling of TCDD and cancer using data from this cohort.

1 **B.1.7. Other Studies of Potential Relevance to Dose-Response Modeling**

2
3
4
5

Table B-20. ‘t Mannetje et al., 2005—All cancer sites combined, site specific analyses

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. National records for death registrations through the New Zealand Health Information Service (NZHIS). Subjects not registered as having died during the study period were confirmed to be actually alive and resident in New Zealand using the New Zealand Electoral Roll, drivers’ license, and social security records.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Seventeen percent of workers were lost to follow up but it is unclear if bias resulted. The dichotomous exposure measure was based on exposure to TCDD, chlorinated dioxins and phenoxy herbicides, so confounding is a possibility by these coexposures.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Dose-response evidence for duration of employment and elevated mortality noted only in synthesis workers.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Exposure measures were limited to duration of employment and exposed/unexposed.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all cancer sites combined, there were 43 cancer deaths among the production workers, and 35 such deaths among the sprayers. Site-specific cancer analyses are limited by small sample sizes.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria not satisfied. <i>Occup Env Med</i> , 2005; 62:34–40. A high percentage of the cohort was lost to follow-up (17%). The authors fail to mention this important limitation in this paper.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. This study used duration of exposure, at an individual level, as a surrogate measure of TCDD.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. Exposure was defined according to duration, and not concentrations of TCDD. Latency intervals were not evaluated.
<hr/>	

This document is a draft for review purposes only and does not constitute Agency policy.

Conclusion	Overall, quantitative exposure data are lacking for TCDD and limited dose-response relationships were observed across duration of exposure categories. Furthermore confounding by coexposures is a possibility. Taken together, these data are not suitable for inclusion in a dose-response analysis
------------	---

1
2
3
4
5

Table B-21. McBride et al., 2009b—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The New Zealand Health Information Service Mortality Collection and the Registrar-General's Index to Deaths. Additional searches were based on the last known address from the work record; the electoral roll and the habitation index; the telephone book; the internet; and Terranet property information database. An additional search was carried out through the Births, Deaths, and Marriages office of the New Zealand Department of Internal Affairs. Lastly, automated personnel and pension records were also used to locate past New Plymouth workers and identify some deaths.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Considerable amount of workers were lost to follow up (22%), but it is unclear if bias resulted. The dichotomous exposure measure was based on exposure to TCDD, chlorinated dioxins and phenoxy herbicides, so confounding is a possibility by these coexposures.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was no examination of dose-response effects.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Dichotomous exposure (exposed/unexposed) and duration of employment were examined from job exposure classification assessed via occupational history records industrial hygienists/factory personnel knowledge and questionnaires. Authors discuss limitations in the assignment of exposure among cohort members.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration not satisfied. A low number of deaths (n = 76) may have limited ability to detect effects small in magnitude and exposure-response relationships.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in <i>Occup Medicine</i> , 2009; 59(4):255–263. The authors highlight cohort lost to follow-up, the limited size of the cohort, differences in cohort definitions between sprayers and producers, and the potential for other exposures during employment at the plant.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. TCDD exposures were not quantified.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. Effective dose could not be estimated given the lack of individual-level exposure data.
Conclusion	The study lacks the quantification of exposures at an individual level precluded dose-response analysis.

Table B-22. McBride et al., 2009a—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The New Zealand Health Information Service Mortality Collection and the Registrar-General’s Index to Deaths were used to identify deaths. Additional searches were based on the last known address from the work record; the electoral roll and the habitation index; the telephone book; the internet; and several other public databases in New Zealand. An additional search was carried out through the Births, Deaths, and Marriages office of the New Zealand Department of Internal Affairs. Lastly, automated personnel and pension records were also used to locate past New Plymouth workers and identify some deaths.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Workers lost to follow-up were an unlikely source of bias especially for internal analyses. Confounding by other coexposures (e.g., 2,4,6-TCP) unlikely to have resulted in bias, due to presumed poor correlation with TCDD.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. The linear test for trend for TCDD exposure was not statistically significant for all cancer sites (combined), as well as lung cancer mortality. Dose-response relationships were not apparent across quartiles of TCDD exposure for all cancer sites combined, digestive cancers, lung cancer, soft tissue sarcomas or Non-Hodgkin’s Lymphoma.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Cumulative exposure to TCDD as a time-dependent metric was estimated for each worker from serum samples, but the authors did not examine a continuous measure of TCDD exposure (lagged or unlagged).
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied.

This document is a draft for review purposes only and does not constitute Agency policy.

1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in J Occup Environ Med 51:1049-1056. This paper discussed the 22% of the cohort lost to follow-up, differences in cohort definitions between sprayers and producers, and the potential for other exposures during employment at the plant.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum measures available for 346 workers were used to derive TCDD exposures for the entire cohort using the area under the curve approach.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria satisfied. Effective dose could be estimated from serum-derived cumulative exposure estimates.
Conclusion	Given that no dose-response associations were found, the data are not suited to dose-response analysis.

2
3
4
5

Table B-23. Hooiveld et al., 1998—All cancer sites combined, site-specific analysis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Outcomes were mortality. Few deaths expected to be missed since only 5% of the cohort was lost to follow-up or had emigrated.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Although dioxin-like compounds (PCDDs, PCDFs, and PCBs) were measured in the serum samples, these were not incorporated into the analysis. Therefore, confounding cannot be ruled out as an explanation of the reported association.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. A dose-response pattern was observed for internal cohort comparison for all cancer mortality, with RRs of 5.0 and 5.6 for the medium and high exposure, respectively. Dose-response patterns evident for lung cancer as well.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Detailed occupational histories to assign dichotomous exposures (exposed/unexposed) based on maximum exposure levels. Although serum data also collected for TCDD and other coexposures (PCDDs, PCDFs, and PCBs), study only presents data for TCDD exposure. TCDD exposures at time of maximum exposure were extrapolated from measured serum.

This document is a draft for review purposes only and does not constitute Agency policy.

5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration not satisfied for internal cohort comparisons in either men or women. Among men, only 7 cancer deaths were observed among those in the unexposed part of the cohort, and 51 among exposed workers. For external cohort comparisons, a total of 20 deaths were observed.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 1998, 147:891–901. The authors address potential limitations of estimating TCDD exposure from a sub-sample of surviving workers, lack of smoking data, the healthy worker effect, and relevance of other occupational exposures.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum samples were obtained from 94 of 144 subjects who were asked to participate in serum measurement study. Of these, a further 44 excluded due to absence due to holiday or work (n = 22), and nonexposed workers excluded because matching exposed worker not participating (n = 20). TCDD levels were extrapolated to the time of maximum exposure.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined.
Response	Criteria not satisfied. Exposures assigned based on levels at maximum exposure. Assignment of exposure based on nonrepresentative sample of 50 survivors among the occupational cohort.
Conclusion	The small number of identified cancer deaths, limitations in terms of the exposure assignment (based on nonrepresentative sample, and maximum exposure level) and concern over potential confounding by coexposures preclude using these data for a dose-response analysis.

1
2

1 **B.2. EVALUATION OF NONCANCER STUDIES**

2 **B.2.1. NIOSH Cohort**

3

4 **Table B-24. Steenland et al., 1999—Mortality (noncancer)**

5

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The study evaluated mortality from all cancer sites (combined). As described in the paper, the sources of vital status and cause of death information were received from the Social Security death files, the National Death Index, and the Internal Revenue Service. Vital status was known for 99.4% of the cohort members, cause of death information is available for 98% of the decedents.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. External comparisons for all-cause and cardiovascular mortality do not appear to be affected by the “healthy worker effect” as similar patterns were observed with internal cohort comparisons. Nonetheless, internal cohort comparisons are unable to adjust for many of the individual-level risk factors for cardiovascular disease.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. A dose-response relationship was observed with ischemic heart disease (linear test for trend $p = 0.05$), and with TCDD on a log-transformed scale the p-value was <0.001 .
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The study conducted detailed sensitivity analyses and evaluated different assumptions regarding latency, log-transformed TCDD exposures, and half-life values for TCDD. Associations were stronger for log-transformed values, and latency intervals of 15 years.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. This is the largest of the occupational cohorts with exposures to TCDD. The cohort consisted of 5,132 male workers and a total of 456 deaths from ischemic heart disease. This permits characterization of risk for all cancer sites (combined)
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied Journal of the National Cancer Institute, 1999, 91(9):779–786. The authors discussed the potential for bias from smoking, and other occupational exposures for which data for both were lacking at an individual basis.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. Exposure scores assigned at an individual level based on job-exposure matrix (JEM). The JEM was based on estimated factor of contact with TCDD in each job, level of TCCD contamination of materials at each plant over time, and proportion of day worker could be in contact with materials. These factors were multiplied together to derive a daily exposure score, which was accumulated over the working history of each worker to obtain a cumulative measure of TCDD.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. The follow-up of the cohort extended from 1942 until the end of 1993. Greater than 25 years of follow-up have accrued in cohort allowing for latency to be examined. Different assumptions on the half-life of TCDD were evaluated and produced similar results. Latency intervals were incorporated, with strongest associations noted no lag. Suggests mechanisms occur at the same time as exposure. However, noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusion	TCDD exposures were quantified in this study, and a dose-response relationship was observed with ischemic heart disease mortality. The sample size was sufficient, and the follow-up interval was lengthy. However, no individual-level data were available for cardiovascular conditions, and the inability to adjust for these exposures introduces considerable uncertainty into the risk estimates. Furthermore, noncancer mortality is not considered a viable endpoint for dose-response analysis.

4

Table B-25. Collins et al., 2009—Mortality (noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Vital status complete for all but two workers.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. No information collected on smoking status, but no excess in lung cancer or nonmalignant respiratory diseases noted. Analyses took into account potential for exposure to pentachlorophenol. External cohort comparisons should be interpreted cautiously due to healthy worker effect, but internal cohort comparisons should not be influence by this bias.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. No statistically significant mortality excess for any noncancer mortality outcome evaluated. This included ischemic heart disease, stroke, nonmalignant respiratory disease, ulcers, cirrhosis, and external causes of death (accidents). Modeling of continuous measure of TCDD was not related to diabetes, ischemic heart disease, or nonmalignant respiratory mortality.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. The authors used these serum from 280 former TCP workers to estimate historical exposure levels of TCDD, furans, and polychlorinated biphenyls for all 1,615 workers. Exposure assessment included detailed work history, industrial hygiene monitoring, and the presence of chloracne cases among groups of workers. This data was integrated into a 1-compartment, first-order pharmacokinetic to determine the average TCDD dose associated with jobs in each group, after accounting for the presence of background exposures estimated from the residual serum TCDD concentration in the sampled individuals. The authors did not evaluate departures from linearity, or examine skewness at higher exposures. No presentation of exposure levels was provided.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 662 deaths were observed. Of these, 218 were from ischemic heart disease, and 16 from diabetes (two outcomes for which associations have been noted elsewhere).
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in Am J Epidemiol, 2009, 170(4):501–506. The authors discuss potential for exposure misclassification, large size of the cohort, lengthy follow-up interval, and large number of workers who provided serum from which TCDD exposures were estimated.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. This study has the greatest number of serum samples obtained from a specific plant.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusions	No dose-response associations were noted for noncancer mortality outcomes. The data are, therefore, not suited for dose-response modeling.

B.2.2. BASF Cohort

Table B-26. Ott and Zober, 1996—Mortality (noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Mortality ascertainment appeared to be fairly complete.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.

Response	Consideration satisfied. Information was collected on smoking status, body mass index, and other occupational exposures, however a large portion of the cohort was firefighters who may have been exposed to other occupational carcinogens. However, the recruitment of survivors may results in under-ascertainment of mortality.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. For external cohort comparisons across the three TCDD exposure categories, there was no dose-response pattern observed for any of the noncancer causes of death. Cox regression risk estimates for all cause or circulatory disease mortality when TCDD was modeled as a continuous variable were not statistically significant.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Cumulative measure of TCDD expressed was derived from serum measures. Exposure was also estimated by chloracne status of the cohort members. The authors have not addressed the potential implication of deriving TCDD exposure estimates for the whole cohort using sera data that were available for only about half of the cohort.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all causes of death, there were 92 deaths, while 37 circulatory deaths. Many of the cause-specific death had less than 5 deaths in the upper exposure category.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. <i>Occup Environ Med</i> , 1996, 53:606–612. A large component of the cohort was assembled by actively seeking out workers who were alive in the mid 1980s. As a result, it is likely a number of deaths were missed. This is supported by much lower SMRs in this component of the cohort published in earlier studies of the cohort. This underascertainment of mortality results in biased SMR statistics (underestimated). The authors do highlight the value of the serum based measures to estimate TCDD exposure
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum samples, taken in 1989, were available for 138 surviving workers out of 254 and allowed for cumulative TCDD levels to be estimated using regression techniques in the remainder of the cohort.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Exposure assignment took into the affect that body mass index had on TCDD half-lives. TCDD levels estimates through back-extrapolation of serum levels based on half-life estimates obtained from previous studies. Latency was considered with stronger association observed in external comparisons incorporating a latency of 20 years. The follow-up of the cohort was lengthy (>50 years). However, noncancer mortality is not a viable endpoint to consider for further dose-response analysis.

This document is a draft for review purposes only and does not constitute Agency policy.

Conclusion	No associations noted with any noncancer deaths. External comparisons should be treated cautiously especially for cardiovascular mortality which is recognized to often be biased by the healthy-worker effect. In the absence of any outcome with an association with TCDD exposure, no dose-response analyses of these data are recommended.
------------	--

1 **B.2.3. Hamburg Cohort**

2
3
4
5

Table B-27. Flesch-Janys et al., 1995; Flesch-Janys et al., 1996 erratum—Mortality (noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Medical records used to identify deaths over the period 1952–1992.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Similarity in smoking rates between control cohort and the exposed workers was similar based on independent surveys. Occupational exposures to benzene, and dimethyl sulfate were unlikely to bias dose-response pattern observed as these exposures occurred in production departments with low to medium levels of TCDD exposure.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Dose-response relationship observed for all-cause mortality, cardiovascular mortality, and ischemic heart disease mortality across 6 exposure categories, with the cohort of gas supply workers used as the referent. The linear tests for trend for these three outcomes were all statistically significant ($p < 0.05$).
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. The exposure measure was an integrated TCDD concentration over time estimate that back-calculated TCDD exposures to the end of the employment. Categorical and continuous TCDD exposures were examined in relation to the health outcome. These efforts improve the exposure assessment of earlier studies.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For all causes of death combined, there were 414 deaths in the exposed cohort, and 943 in the cohort of gas supply workers. A total of 157 and 76 deaths from cardiovascular disease, and ischemic heart disease were noted. The corresponding number in the cohort of gas supply workers was 459, and 205, respectively.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 1995, 144:1165–1175. The authors discuss the potential role of other occupational exposures (i.e., dimethyl sulfate, solvents, benzene), smoking, and suitability of the comparison cohort of gas supply workers.

This document is a draft for review purposes only and does not constitute Agency policy.

2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum and adipose tissues were used to estimate TCDD exposure in 190 workers. A one-compartment first-order kinetic model was used to estimate exposure at end of exposure for these workers. Regression methods were then used to estimate TCDD exposures for all workers.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Exposure based on half-life estimates from individuals with repeated serum measures. Other dioxin-like compounds were considered with the TOTTEQ exposure metric. Noncancer mortality, however, is not a viable endpoint to consider for further dose-response analysis.
Conclusion	Although, the exposure data used within this study are well-suited to a dose-response analysis for all-cause and cardiovascular mortality given the associations observed, use of noncancer mortality endpoint is not amenable for further dose-response analysis.

1 **B.2.4. The Seveso Women’s Health Study**

2
3
4

Table B-28. Eskenazi et al., 2002a—Menstrual cycle characteristics

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Information was also obtained from medical records for all obstetric and gynecologic conditions. Information on menstrual cycles was obtained from questionnaires. Women were asked about length of cycles, regularity, how many days flow lasted, and heaviness of menstrual flow (scanty, moderate, or heavy). Measurement error is likely for the subjective nature of self-reported menstrual parameters but specificity and sensitivity is difficult to ascertain due to lack of validation data for these measures.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Detailed risk factor information was collected from questionnaire, allowing for the potential confounding influence of many risk factors to be controlled for. The length of cycle study findings may have been affected by the presence of a few outliers.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. A positive dose-response relationship was found with TCDD among women who were premenarcheal at time of the explosion and longer menstrual cycle. Increased TCDD resulted in a reduced odds of scanty menstrual flow. No association was noted with these two outcomes among postmenarcheal women. A decreased risk of irregular cycles was observed with higher TCDD levels.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Cohort was large enough as analyses were conducted on 301 women.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2002; 156(4) 383–392. Limitations included an inability to assess affects on menstrual cycle at time body burdens were the highest (at time of the accident). Also, TCDD was estimated for 1976, not concurrent with their cycles in the previous year, and a large number of women were excluded due to intrauterine device or oral contraceptive use. Strengths included population-based nature of study, with characterization of exposure using serum, and levels of other polychlorinated dibenzo-p-dioxins and dibenzofurans were at background levels. Findings for length of menstrual cycle may be unduly influenced by the presence of some outliers.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. The study population was based on 301 women as those who were over the age of 44 were excluded, as well as women with surgical or natural menopause, women with Turner’s syndrome, those who had been pregnant or breastfed in the past year, and those who had used an intrauterine device or oral contraceptives. For 272 women, TCDD levels were based on serum data provided in 1976; TCDD levels were back-extrapolated to 1976 levels for the other 29 women.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response had to be a nonfatal endpoint.
Response	Criteria satisfied. Ideally, TCDD exposures would be concurrent with reporting of cycle characteristics. Herein, TCDD exposures were based on levels in 1976; however, given the long half-life of TCDD and the same follow-up interval for all women, TCDD exposures in 1976 should correlate well with levels near the time of interview. Further, the critical window of exposure can be estimated for the women that were premenarcheal at the time of the accident (13 years).
Conclusion	This study meets all of the criteria and considerations for further dose-response analysis. The determination of the relevant time interval over which TCDD dose should be considered is uncertain .

1
2
3
4

Table B-29. Eskenazi et al., 2002b—Endometriosis

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration not satisfied. Results of a pilot study showed that ultrasounds had excellent specificity and sensitivity for ovarian endometriosis.

2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. More than half of the women were classified as ‘uncertain’ with respect to endometriosis disease status.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. While an increased risk of endometriosis was observed across the 3 TCDD categories, these risks were not statistically significant relative to the lowest exposure category. The test for trend based on a continuous measure (\log_{10} TCDD) was also not statistically significant.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration not satisfied. Only a total of 19 cases of endometriosis were identified.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect 2002; 110(7) 629–634. Author’s highlight that this is the first study to examine the relationship between TCDD and endometriosis, and the availability of sera data to estimate TCDD levels. Limitations included the small number of women with endometriosis, and inability to confirm disease status using laparoscopy. Finally, young women may have been underrepresented due to cultural difficulties in examining women who had never been sexually active.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Eligible study subjects were women between 1 month and 40 years of age at time of accident. These analyses excluded virgins, those with Turner’s syndrome, and women who refused the examination of ultrasound. Serum data were available for the 601 participants on which the analyses are based. Of these, 559 had serum measures taken in 1976/77, 25 between 1978 and 1981, and 17 women in 1996.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. TCDD exposure was estimated at the time of “conception attempt” using serum measures, with extrapolation from 1976 levels using half-life assumptions. It is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis. The critical window of exposure is unknown.
<hr/>	
Conclusion	The lack of a statistically significant association coupled with a large number of women for which endometriosis disease status was “uncertain”, precludes the use of these data to conduct dose-response analysis.

This document is a draft for review purposes only and does not constitute Agency policy.

Table B-30. Eskenazi et al., 2003—Birth outcomes

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration not satisfied. Outcomes were identified through self-reported questionnaires. Women were found to over-report birth weight, and have a tendency to underreport birth defects in children. As a large number of women in Seveso underwent voluntary abortion in the first year after the explosion, an awareness bias may have contributed to differential reporting of pregnancy histories.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. See above.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was no association between spontaneous abortions and \log_{10} TCDD, or with births small for gestational age. An inverse association with birth weight was noted in first eight years following the accident as were the number of births small for gestational age; however, none achieved statistical significance at $p < 0.05$.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For spontaneous abortions there were 769 pregnancies. Fetal growth and gestational age analysis was carried out on 608 singleton births that occurred post-explosion.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 2003, 111(7):947–953. The authors highlight potential limitation of reliance on self-reported data to ascertain pregnancy outcomes. They also address the relevance of paternal exposures to TCDD on the developing fetus—such exposure data were not considered in this study.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. A total of 745 women in the SWHS had reported getting pregnant, of these 510 women were pregnant after the explosion (888 pregnancies). Analyses of spontaneous abortions based on 476 women (excludes those with voluntary abortion, ectopic pregnancy, or molar pregnancy. TCDD measured for 413 women in 1976/77, 12 women between 1978 and 1981, and 1996 for 19 women.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. TCDD exposures were extrapolated to 1976 values. However, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis.
Conclusion	The findings of the study are somewhat limited due to the reliance on self-reported information for pregnancy outcomes, and lack of paternal exposures. The findings were not statistically significant. Taken together, quantitative dose-response analyses for this study population is not recommended.

4

Table B-31. Warner et al., 2004—Age at menarche

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. In this study age at menarche was based on retrospective recall 5 to 19 years before the interview. Previous work suggests moderate to high correlations between actual and recalled menarche, misclassification of outcome would bias risk estimates towards the null (assuming nondifferential misclassification.)
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Data collected from self-reported questionnaires allow for the potential confounding influence of many risk factors to be taken into account. Some misclassification of outcome may bias risk estimates towards the null.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was no association between TCDD levels and the age at menarche with either the continuous or categorical measures of TCDD.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Cohort was large enough as analyses were performed using 282 women who were premenarcheal at the time of the explosion.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 2004, 112:1289–1292. Authors discuss use of pooled serum from residents of the unexposed zone, and that those in lowest exposure group had high exposures relative with contemporary levels for the area. Strengths of study include use of serum to estimate TCDD exposure.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria satisfied. The SWHS included women between 1 month and 40 years of age at time of accident who attempted to get pregnant after the explosion (n = 463). This study is restricted to those who were premenarcheal at the time of the explosion (n = 282). Serum was collected for these women, primarily in 1976–1977 (n = 257), between 1978 and 1981 for 23, and in 1996–1997 for the 2 remaining women.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. TCDD exposures in 1976 were estimated by extrapolation serum levels obtained after this date using the Filser model. Both categorical and continuous measures of exposure were modeled. In utero measures of exposure are likely most relevant exposure based on findings from animal studies.
Conclusion	No association between TCDD levels and age at menarche was found. There may be some misclassification of age at menarche based on self-report, and biologically, the most relevant dose as suggested by animal studies occurs in utero. Additionally, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis. For these reasons, these data are not suited to a dose-response analysis.

3
4

Table B-32. Eskenazi et al., 2005—Age at menopause

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Outcome measures were obtained based on self-reported data collected from questionnaires. Studies have shown that self-reports of age at menopause are reported with accuracy and reliability, and among women with surgical menopause, the self-reported age correlated well with that on the medical records.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Data obtained from the questionnaire allow for the potential confounding influence of several potential confounders to be controlled for.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. Although risks of earlier menopause increased in the first four quintiles, with a statistically significant trend, no increased risk was noted in the highest exposure category (hazard ratio = 1.0 relative to lowest exposure group). Study authors suggest this is due to the “inverted U” dose response often seen with hormonally active compounds. Additionally, no statistically significant association was noted with log ₁₀ TCDD for the individual quintiles.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.

This document is a draft for review purposes only and does not constitute Agency policy.

5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. The study included 616 women. Of these, 260 were premenopausal, 169 classified as natural menopause, 83 as surgical menopause, 24 as impending menopause, 33 as premenopausal, and 58 in an “other” category.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 113:858–862 (2005). Authors highlight this is first study to look at relationship between dioxin and age at menopause. Other limitations of the study include lowest exposure group (≤ 20.4 ppt) includes exposures level that are far higher than background, and age at menopause was based on retrospective recall. Strength of study is ability to characterize TCDD using serum measures.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. The Seveso Women’s Health Study collected serum sample which allowed TCDD exposures to be characterized. Those women (n = 616) who had not reached natural menopause at the time of the accident were included in the study. Serum measures collected in 1976/77 were available for 564 women, for 28 women, sera was collected between 1978 and 1981, while for 24 women, sera was collected in 1996/97.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. TCDD levels were estimated at the time of the explosion using available information on TCDD half-life. However, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis. The critical window of exposure can be estimated but is large and highly uncertain.
Conclusion	The findings do not provide strong support for a dose-response relationship. As such, they are not well suited to a quantitative dose-response analysis.

2
3
4

Table B-33. Warner et al., 2007—Ovarian function

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Ovarian cyst analysis based on women who underwent ultrasound (n = 310). Ovarian follicle analysis based on self-report on menstrual cycle and done in women in pre-ovulatory cycle (n = 96) at time of ultrasound. Hormonal analysis based on women in last 14 days of cycle (n = 129).
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Data collected from self-reported questionnaires allow for the potential confounding influence of many risk factors to be taken into account. Some misclassification of outcome based on self-reports of menstrual cycle may bias risk estimates towards the null.

This document is a draft for review purposes only and does not constitute Agency policy.

3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was no association between serum TCDD levels and the number or size of ovarian follicles. TCDD was also not associated with the odds of ovulation.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Criteria satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging given the nature of the very high initial exposure.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Cohort was large enough as analyses were performed using 129 women for ovulation outcome, and hormone analyses based on 87 women in luteal, and 55 in midluteal phases.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environ Health Perspect, 2007,115:336–340. An important limitation cited by the authors was that women may not have been exposed at critical period (prenatally). Phases of the cycle may also have been misclassified as this was based on self-reported data. Strength, first study to have examined ovarian function and TCDD exposures.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. The SWHS included women between 1 month and 40 years of age at time of accident who were between 20–40 years of age and not using oral contraceptives at follow-up (n = 363). Of these, serum was collected for 330 women between 1976 and 1977, between 1978 and 1982 for 25 women, and between 1996 and 1997 for 8 women.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. The women may not have been exposed at critical period (prenatally).
Conclusion	No association between TCDD levels and ovarian function was found. There may be some misclassification of period of the cycle based on self-report, and biologically, the most relevant dose as suggested by animal studies occurs in utero. For these reasons, these data are not suited to a dose-response analysis.

Table B-34. Eskenazi et al., 2007—Uterine leiomyoma

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
------------------	---

Response	Consideration satisfied. Outcomes were determined using two definitions: current fibroids, or past diagnosis of fibroids. For past diagnosis of fibroids, self-reported data and medical records were used to determine whether women were previously diagnosed with fibroids, these were confirmed with medical records. A total of 25 women indicated they had never been diagnosed with fibroids. Medical records indicate a past diagnosis for these women, and they were classified as such. For current fibroids, this was determined at the time of the interview for 634 women using transvaginal ultrasound examinations.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. In the SWHS questionnaires were administered to the participants and detailed data for reproductive characteristics, smoking, body mass index, and alcohol use were collected so risks could readily be adjusted for these covariates.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied, but inversely. An inverse dose-response pattern with the percentage of women diagnosed (current & past history-combined) with fibroids across 3 categories of exposure. Namely, the percentages of women with fibroids in the ≤ 20 , 20.1–75.0, and >75.0 ppt categories were 41.1%, 26.8%, and 20.0%, respectively.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. A variety of different exposure metrics were considered including linear, categorical, splines, and \log_{10} TCDD.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 251 women were found to have fibroids, and there were 62, 110, and 79 women with fibroids diagnosed in the 3 TCDD exposure categories.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2007, 166:79–87. In this study, the authors found an inverse association between TCDD and uterine leiomyoma risk. The authors highlighted strengths of the study that included the longitudinal design, serum measures taken at an individual-level basis and most taken within 2 years of the accident, ability to include outcomes among those who did not take an ultrasound by using an adapted statistical approach. An important limitation that was the differences in risk by the stage of development could not be assessed as all women were exposed postnatally, and only 4 cases were observed among those who were premenarcheal at the time of exposure.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Final sample consisted of 956 women in the Seveso Women’s Health Study without a history of fibroids. For 872 of these women, serum was collected in 1976 and 1977. For 56 women, TCDD was measured in women between 1978 and 1981, and for 28 women the serum was collected in 1996.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. TCDD exposures were back extrapolated to expected levels in 1976 (at the time of the accident). However, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis. The critical window of exposure is unknown.
Conclusion	The data suggest an inverse (protective) effect between fibroids and exposure to TCDD. As such, these data are not suited to further dose-response analyses.

B.2.5. Other Seveso Noncancer Studies

Table B-35. Mocarelli et al., 2008—Semen quality

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Serum levels of TCDD were measured on an individual basis for men in exposed areas; pooled samples from men in uncontaminated areas were measured to assess background TCDD exposure levels.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. While compliance rates may have introduced some possible bias, this does not seem likely as different effects noted between the 22–31 and 32–39 year old age groups. Information collected for other risks factors, which have been used as adjustment factors in the models.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Figure 3 suggests dose-response relationship among those aged 1–9 at the time of the accident for sperm concentration and motility.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Serum concentrations of TCDD offer improved exposure assessment, although delineating the critical exposure window is challenging.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Analyses are based on 135 males exposed to TCDD.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environmental Health Perspectives, 2008, 116(1):70–77. The authors describe strengths associated with characterization of exposure (using serum samples), and representativeness of study population. Limitation of study includes low compliance (but high for semen sample studies), namely, 60% among a group of healthy men. The compliance rate was higher among exposed group (69%).
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria satisfied. Involved males, < 16 years old at time of accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria satisfied. TCDD exposures were based on serum samples. Serum samples were drawn (in 1997/1998) from participants whose 1976 samples were above 15 ppt. Pooled samples obtained in 1997/98 were used to describe background TCDD levels in uncontaminated areas. The association between TCDD exposure and semen quality was found statistically significant for the boys with 1 and 9 years of age at the time of the accident. This provides a critical window of exposure to estimate TCDD concentration.
Conclusion	Health outcomes are exposures are well characterized using serum data. However, the men exposed between the ages of 1 and 9 to elevated TCDD levels had reduced semen quality 22 years later. It is difficult to discern whether this effect is a consequence of the initial high exposure between 1 and 9 years of age or a function of the cumulative exposure for this entire exposure window beginning at the early age. Nonetheless, quantitative dose-response analyses for this outcome were conducted.

1
2
3
4

Table B-36. Mocarelli et al., 2000—Sex ratio

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Birth records examined for those who lived in parents who lived in the area and who provided serum samples.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Paternal TCDD exposures were associated with an increased probability of female births ($p = 0.008$).
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Serum samples were used to estimate maternal and paternal TCDD levels. No discussion of exposure levels in reference population.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Statistically significant findings achieved.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria not satisfied. The Lancet, 2000, 355:1858–1863. There is no discussion on the strengths and limitations of this study.

This document is a draft for review purposes only and does not constitute Agency policy.

2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum levels of TCDD were obtained from parents using samples provided in 1976/77. Serum measures available for 296 mothers and 239 fathers.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Serum based measures of TCDD were obtained shortly after the accident. TCDD levels were also extrapolated to the time of conception. However, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis. The critical window of exposure is unknown.
Conclusion	The data from this study demonstrate a positive dose-response relationship with paternal TCDD levels at the time of the accident and increased likelihood for female births. However, It is difficult to identify the relevant time interval over which TCDD dose should be considered; specifically, it is difficult to discern whether this effect is a consequence of the initial high exposure during childhood or a function of the cumulative exposure for this entire exposure window beginning at the early age. Using the initial exposures in a dose-response model would yield LOAELs that are too high to be relevant to factor into the RfD calculation. Dose-response analysis for this outcome is, therefore, was not conducted.

1
2
3
4

Table B-37. Baccarelli et al., 2008—Neonatal thyroid function

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Measures of b-TSH are taken using a standardized protocol 72 hours after birth. These b-TSH measures are taken on all newborns born in the region of Lombardy of which Seveso is a part of.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied for component of the study based on plasma dioxin measures. For the comparisons involving place of residence at the time of the accident, exposure misclassification is likely given variability in soil TCDD exposure levels within these areas.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Mean neonatal b-TSH was 0.98 μ U/ml [0.90–1.08] in the reference area, 1.35 μ U/ml [1.22–1.49] in zone B, and 1.66 μ U/ml [1.19–2.31] in zone A ($p < 0.001$). The plotted frequency distributions have similar shapes, but have shifted to the right for areas of higher exposures. Neonatal b-TSH was correlated with current maternal plasma TCDD ($\beta=0.47$, $p < 0.001$) in the 51 newborns for which individual maternal serum TCDD values were available.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. TEQs were measured among the 38 women for which serum samples were available and were defined for a mixture of dioxin-like compounds. Maternal mean total TEQs (PCDDs, PCDFs, coplanar PCBs, and noncoplanar PCBs) was 41.8 ppt. Two measures of exposure included place of residence at time of accident and plasma samples obtained from mothers at the time of delivery. Similarities in positive dose-response relationships give stronger weight to the findings.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied for exposure metric that was based on ‘place of residence’. For plasma based estimate of maternal TCDD there were only 51 mother-child pairs. Only seven children in total were found to have b-TSH levels in excess of 5 uU/ml; this implies limited statistical power involving this health outcome.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. PLOS Medicine 2008; 5(7)1133–1142. The authors discuss the strength of the study related to characterization of exposure using serum sampling, and ability to adjust for factors related to b-TSH or TCDD levels (gender, birth weight, birth order, maternal age, hospital and type of delivery). They also highlight that a limitation of study was that the influence of mother-child dioxin transfer through colostrum could not be assessed because no information on breastfeeding before b-TSH measurement was available.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. In the population-based study, eligible women who resided in zones A and B at the time of the accident (n = 1,772) were matched to nonexposed women. In the study based on plasma dioxin measurements, participants were the 51 children born to 38 women from zones A, B, R, or a reference zone for which plasma dioxin measurements were available.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria satisfied. Maternal TCDD levels were estimated at the time of delivery based on plasma samples, and the critical window of exposure can be defined as the 9 month gestation period.
Conclusion	The data provide an opportunity for quantitative dose-response analyses.

1
2
3
4

Table B-38. Alaluusua et al., 2004—Oral hygiene

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Ascertainment of dental health was done blind to place of residence, used standard protocol for caries developed by the WHO, and the clinical examination supplemented by radiographic examination.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. Additional risk factor information was collected on questionnaires. These factors were considered as adjustment factors. Findings potentially susceptible to participation biases.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Increased prevalence of developmental enamel effects found with increased TCDD serum measures. Namely, prevalence in unexposed region was 26%, whereas in the low, middle, and high TCCD groups the prevalence was 10, 40, and 60%, respectively.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. TCDD exposure level based on serum lipids. No discussion of exposure levels in reference population.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Criteria satisfied. Despite small numbers, statistically significant findings were achieved.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Environmental Health Perspectives, 2004, 112(13)1313–1318. Authors mention two important strength of the study: characterization of TCDD exposure using serum collected shortly after the time of the accident, and the fact that developmental defects are permanent in nature. Therefore, they represent a health outcome can evaluated years later. Little discussion was made of the impact of differential compliance rates between the exposed (74%) and nonexposed (58%) groups. Authors mention two important strength of the study: characterization of TCDD exposure using serum collected shortly after the time of the accident, and the fact that developmental defects are permanent in nature. Therefore, they represent a health outcome can evaluated years later. Little discussion was made of the impact of differential compliance rates between the exposed (74%) and nonexposed (58%) groups.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum levels of TCDD could be estimated for children in exposed areas. No serum levels were available for reference group of children, and assumption of zero exposure was made. This seems reasonable.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria satisfied. It is difficult to discern whether this effect is a consequence of the initial high exposure during childhood or a function of the cumulative exposure of the entire exposure window beginning at early age. However, assumptions can be made regarding the critical window of exposure and the relevant dose can be calculated.

This document is a draft for review purposes only and does not constitute Agency policy.

Conclusion	The considerations for conducting a dose-response analysis have been satisfied with the study population of only those subjects who lived in the ABR zone at the time of the accident; exposure data are unavailable for those in the referent area. While it is difficult to identify the relevant time interval over which TCDD dose should be considered, quantitative dose-response analysis for this outcome was conducted.

Table B-39. Bertazzi et al., 2001—Mortality (Noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied for some causes of death, but not others. Mortality appears to be well captured from the vital statistics registries in the region (99% complete). Some health outcomes (e.g., diabetes) are subject to misclassification using death certificate data.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Although individual-level data for individual risk factors are not available, the potential for confounding is likely minimal. For e.g., independent surveys suggest similarity between smoking behaviors across the regions. Exposure misclassification based on place of residency likely to bias risk estimates towards the null.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied for most causes of death. An exception was the dose-response relationship was observed for chronic obstructive pulmonary disease across Zones A, and B.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Exposure classification was based on the address of the residence on the date of the accident or when the person first entered the area. Although TCDD blood levels were also measured, these were not examined with respect to health outcomes. The lack of individual-level data also precluded an examination of these uncertainties.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 494 non-cancer deaths were found among residents of Zones A, and B, respectively. This allowed examination of gender-specific effects.
<hr/>	
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2001, 153:1031–1044. Authors discuss lack of individual-level exposure data and other risk factors (e.g., smoking), difficulties in extrapolating to background levels, diagnostic accuracy of using death certificates. Strengths included similarities between exposed and comparison population for several risk factors, completeness of follow-up, and consistent methods to identify mortality outcomes in the exposed and comparison populations.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. Individual-level exposure data are unavailable. Exposure based on place of residence at time of the explosion. Soil sampling performed indicated considerable variability in TCDD levels within each region. In addition, place of residency at time of explosion does not ensure individuals were at their home around the time of the accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. An ecological measure of exposure (region of residency at time of accident) was used to categorize individuals according to their possible exposure. Latencies were considered. While such an approach has value for identifying whether excesses occurred among highly exposed populations, it is not precise enough to conduct a quantitative dose-response analysis. Furthermore, noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusion	Study is not suitable for dose-response analysis due to mortality as endpoint and lack of individual-level exposure data.

Table B-40. Consonni et al., 2008—Mortality (Noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied for some causes of death, but not others. Mortality appears to be well captured from the vital statistics registries in the region (99% complete). Some health outcomes (e.g., diabetes) are subject to misclassification using death certificate data.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Although individual-level data for individual risk factors are not available, the potential for confounding is likely minimal. For e.g., information from other independent surveys suggests similarity between smoking behaviors across the regions. Exposure misclassification based on place of residency is likely to bias risk estimates towards the null.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. Statistically significant association noted in most highly exposed area for chronic rheumatic disease and chronic obstructive pulmonary disease. Dose-response pattern noted across Zones A, B and R for circulatory disease mortality 5–9 years after the accident.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. Lack of individual-level data precludes an examination of these uncertainties.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied for some causes of death but not others. For example, only three deaths from diabetes occurred among residents of Zone A. The limitation related to statistical power is exacerbated for stratified analyses carried out by number of years since the accident.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Am J Epidemiol, 2008, 167:847–858. Authors discuss potential for selection bias, limitation of residential based measure of exposure, similarities of mortality ascertainment in exposed and referent populations, and multiple testing.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Individual-level exposure data are unavailable. Exposure based on place of residence at time of the explosion. Soil sampling performed indicated considerable variability in TCDD levels within each region. In addition, place of residency at time of explosion does not ensure individuals were at their home around the time of the accident.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. An ecological measure of exposure (region of residency at time of accident) was used to categorize individuals according to their possible exposure. Latencies were considered. While such an approach has value for identifying whether excesses occurred among highly exposed populations, it is not precise enough to conduct a quantitative dose-response analysis. Furthermore, noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusion	Study is not suitable further dose-response evaluation due to noncancer mortality endpoint.

4

Table B-41. Baccarelli et al., 2005—Chloracne

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Chloracne cases identified using standardized criteria.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Plasma TCDD was associated with an increased risk of chloracne. The odds ratios increased in a dose-response pattern across zone of residence.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Authors discussed implications of differential elimination rates by age and body growth.

This document is a draft for review purposes only and does not constitute Agency policy.

5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. A total of 101 chloracne cases were identified, and 211 controls were selected. Statistically significant findings were observed in several comparisons.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. British Journal of Dermatology, 2005, 152, 459–465. The authors detail the limited statistical power they had available in the study. They also highlight a strength of the study that included uniqueness of age and sex distribution of chloracne cases, characterization of TCDD that could be done using sera samples, and availability of both clinical and epidemiological data.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. TCDD was estimated in both chloracne cases and control using serum measures.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria satisfied. Serum based measures of TCDD were obtained shortly after the accident. Chloracne is thought to be caused by the initial high exposure.
Conclusion	Exposure to TCDD at sufficiently high levels is recognized to cause chloracne. This study provides limited relevance to dose-response modeling of TCDD as exposure levels typically observed in the general population are much lower.

Table B-42. Baccarelli et al, 2002 and 2004—Immunological effects

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Common methods were used to describe blood levels of plasma immunoglobulins (IgA, IgG, and IgM) and complement components (C3 and C4).
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Both exposure and outcome were objectively and accurately measured.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration satisfied. Plasma IgG levels were inversely related with TCDD.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Both categorical (quintiles) and continuous measures of TCDD were examined in the dose-response analysis.

This document is a draft for review purposes only and does not constitute Agency policy.

5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Analyses are made using 72 highly exposed, and 72 low exposed individuals.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Toxicology letters, 2004, 149:287–293 and Environ Health Perspect, 2002, 110(12):1169–1173. The authors highlight that few studies have looked at immunological effects of TCDD in humans, that the current study was able to exclude those with concurrent medical conditions, and the ability to characterize exposure using serum measures. Limitations addressed were the uncertainty about the clinical relevance of the dose-response pattern found, and the relatively small size of the study population.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. A total of 120 subjects were included in the study. This included 62 randomly selected from the high exposed zone, and 58 selected from the reference area.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Dose-response relationships were examined using current TCDD levels. However, it is difficult to identify the relevant time interval over which TCDD dose should be considered for dose-response analysis.
Conclusion	An inverse dose-response association between IgG and TCDD was observed, however, because the relationship can not be described in terms of clinical relevance with respect to a specific health outcome, it is our view that these data are not suited to dose-response modeling.

B.2.6. Chapaevsk Study

Table B-43. Revich et al., 2001—Mortality (noncancer) and reproductive health

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration cannot be evaluated. Insufficient details are provided in the paper to gauge the completeness and coverage of the cancer registry and mortality data. Health outcomes were studied on the basis of information in the official medical statistics
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. It is an ecological study.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration cannot be evaluated. Dose-response was not evaluated as exposure was based on residency in the region vs. no residency.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. No individual-level exposure estimates were used.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. Population-based data over several years were used to make ecological comparisons.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in <i>Chemosphere</i> , 2001, 43(4–7):951–966.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. It is a cross-sectional study that compares mortality rates between regions. No individual-level exposure data available.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. No exposure estimates were used in the study.
Conclusion	These cancer data are cross-sectional in nature and not appropriate for a dose-response analysis.

1 **B.2.7. Air Force Health (“Ranch Hands”) Study**

2
3
4

Table B-44. Michalek and Pavuk, 2008—Diabetes

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. Prevalent diabetes identified from medical records from repeated medical check-ups. Preferred method of ascertaining outcome relative to use of death certificates.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Adjustment was made for a number of risk factors related to diabetes (e.g., BMI, family history, smoking). However, Agent Orange was a 50% mixture of 2,4-D and TCDD; therefore, potential for confounding by other coexposures is likely.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Consideration satisfied. The RR for an increase in 10 units was 1.29 ($p < 0.001$), and the risks across the background, low and high exposure categories, relative to the unexposed were 0.86, 1.45, and 1.68.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Initial TCDD dose were estimated at the end of the tour of duty for the Ranch Hands. Individual-level serum dioxin measurements correlated well with correlated with days of spraying and calendar period of service, but collection of the samples roughly 20 years later required back-extrapolation.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. There were a total of 439 cases of diabetes identified.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. J Occup Environ Medicine, 2008, 50:330–340. The authors address strengths and limitations related to the accuracy of the one-compartment pharmacokinetic model, impact of the covariate time spent in Southeast Asia, and potential exposure misclassification on days sprayed.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. TCDD estimates were derived using serum samples. However, Ranch Hand veterans were exposed to other compounds in the herbicides, such as 2,4-D.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria satisfied. TCDD levels at the end of service were estimated. Extrapolation was done using a half-life of 7.6 years. Exposures were grouped into comparison, background, low and high. This allows for a shape of the dose-response curve to be evaluated. A continuous measure of TCDD was also examined (\log_{10} TCDD).
Conclusion	Ranch Hand veterans were exposed to other contaminants in the herbicides that were mixed, thereby making it difficult to determine independent effects of TCDD on diabetes. In our view, this limitation precludes dose-response modeling of TCDD and diabetes using data from this cohort.

B.2.8. Other Noncancer Studies of Dioxin

Table B-45. McBride et al., 2009a—Mortality (Noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
------------------	---

Response	Consideration satisfied. The New Zealand Health Information Service Mortality Collection and the Registrar-General's Index to Deaths were used to identify deaths. Additional searches were based on the last known address from the work record; the electoral roll and the habitation index; the telephone book; the internet; and Terranet property information database. An additional search was carried out through the Births, Deaths, and Marriages office of the New Zealand Department of Internal Affairs. Lastly, automated personnel and pension records were also used to locate past New Plymouth workers and identify some deaths.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration satisfied. Workers lost to follow-up were an unlikely source of bias especially for internal analyses. Confounding by other coexposures (e.g., 2,4,6-TCP) unlikely to have resulted in bias, due to presumed poor correlation with TCDD.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. There was no cause of death among those considered for which a dose-response trend was observed across four exposure categories of TCDD.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Dichotomous exposure (exposed/unexposed) and duration of employment were examined from job exposure classification assessed via occupational history records industrial hygienists/factory personnel knowledge and questionnaires.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration not satisfied.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in J Occup Environ Med, 2009, 51:1049–1056. The other studies in the cohort highlight the 22% of the cohort lost to follow-up, the limited size of the cohort tissue sarcomas, differences in cohort definitions between sprayers and producers, and the potential for other exposures during employment at the plant.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria satisfied. Serum measures available for 346 workers were used to derive TCDD exposures for the entire cohort using the area under the curve approach.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. Dichotomous exposure assessment did not allow individual estimates of dose to be developed. However, noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusion	A considerable portion of the cohort was lost to follow-up, and no dose-response associations noted. As a result, the data are not suited to dose-response analysis.

Table B-46. McBride et al., 2009b—Mortality (noncancer)

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration satisfied. The New Zealand Health Information Service Mortality Collection and the Registrar-General’s Index to Deaths were used to identify deaths. Additional searches were based on the last known address from the work record; the electoral roll and the habitation index; the telephone book; the internet; and Terranet property information database. An additional search was carried out through the Births, Deaths, and Marriages office of the New Zealand Department of Internal Affairs. Lastly, automated personnel and pension records were also used to locate past New Plymouth workers and identify some deaths.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. Considerable amount of workers were lost to follow up (22%), but it is unclear if bias resulted. The dichotomous exposure measure was based on exposure to TCDD, chlorinated dioxins and phenoxy herbicides, so confounding is a possibility by these coexposures.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. Because no individual exposure estimates were available for these analyses, dose-response could not be evaluated.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration satisfied. Consideration satisfied. Dichotomous exposure (exposed/unexposed) and duration of employment were examined from job exposure classification assessed via occupational history records industrial hygienists/factory personnel knowledge and questionnaires. Authors discuss limitations in the assignment of exposure among cohort members.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria satisfied. Published in <i>Occup Medicine</i> , 2009, 59(4):255–263. The authors highlight cohort lost to follow-up, the limited size of the cohort, differences in cohort definitions between sprayers and producers, and the potential for other exposures during employment at the plant.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.
Response	Criteria not satisfied. Exposures were not quantified. The dichotomous exposure measure was based on exposure to TCDD, chlorinated dioxins and phenoxy herbicides.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Effective dose could not be estimated given the lack of individual-level exposure data. Noncancer mortality is not a viable endpoint to consider for further dose-response analysis.
Conclusion	The study lacks the quantification of exposures at an individual level, and a considerable portion of the cohort was lost to follow-up. As a result, the data are not suited to dose-response analysis.

1
2
3
4

Table B-47. Ryan et al., 2002—Sex ratio

1. Consideration	Methods used to ascertain health outcomes identified were unbiased, highly sensitive, and specific.
Response	Consideration not satisfied. Company records were used to identify births, the date of birth, and the sex of the child. No information was provided on the expected completeness of identifying births in this manner. Moreover, the study was expanded to include workers who heard about the study in a public forum. Therefore, the study could be influenced by participation bias.
2. Consideration	Risk estimates are not susceptible to biases from confounding exposures or from study design or statistical analysis.
Response	Consideration not satisfied. See above.
3. Consideration	Study demonstrates an association between TCDD and adverse health effect with evidence of an exposure-response relationship.
Response	Consideration not satisfied. The study compared birth ratios among men and women employed at the plant to the general population. No categories of exposure were examined.
4. Consideration	Exposure assessment methodology is clear and adequately characterizes individual-level exposures. The limitations and uncertainties in the exposure assessment are considered.
Response	Consideration not satisfied. This is not relevant as no analyses were done in relation to exposure levels.
5. Consideration	Study size and follow-up are large enough to yield precise estimates of risk and ensure adequate statistical power.
Response	Consideration satisfied. For the categories of exposure used (yes/no), and the stratified analyses by sex and subcohort, the study allows for the birth ratios to be estimated with sufficient precision.
1. Criteria	Study is published in the peer-reviewed scientific literature and has an appropriate discussion of the strengths and limitations.
Response	Criteria not satisfied. Published in Environ Health Perspect, 2002, 110(11):A699–A701. The authors discussed the limitations of using serum collected many years after they stopped working to estimate TCDD exposures when the preferred metric would be TCDD levels at the time of conception. They did not address issues about the representativeness of the study participants to the entire cohort of workers, nor did they address the limitation of not being able to conduct dose-response analyses using individual-level TCDD data.
2. Criteria	Exposure must be primarily TCDD and is properly quantified so that dose-response relationships can be assessed.

This document is a draft for review purposes only and does not constitute Agency policy.

Response	Criteria not satisfied. While serum measures were available for 84 of the 198 participants of the study, birth ratios were compared between the cohort of 2,4,5-T and 2,4,5-trichlorophenol workers relative to the city of Ufa. There was no attempt to derive birth ratios in relation to exposure levels. The serum data were only used to demonstrate that these workers, on average, had TCDD levels 30 times higher than Ufa residents.
3. Criteria	The effective dose and oral exposure can be reasonably estimated and the measures of exposure are consistent with the current biological understanding of dose. The reported dose is consistent with a toxicologically relevant dose. Latency and appropriate window(s) of exposure examined. Response has to be a nonfatal endpoint.
Response	Criteria not satisfied. TCDD exposures were based on serum measures taken in some cases many years after children were born; no attempt was made to back-extrapolate to the time of conception.
Conclusion	The data are not suitable for dose-response modeling. Risk estimates have not been derived in relation to TCDD exposure levels. There exist uncertainties about the representativeness of the participants in relation to the cohort as a whole, and insufficient details are provided to evaluate the extent in which all births were identified. While these data should not be used for quantitative dose-response modeling, the much lower M/F birth ratio among exposed fathers is consistent with the finding by Mocarelli et al, and lends support to those findings.

1 **APPENDIX C. KINETIC MODELING**

2
3
4 **C.1. LITERATURE SEARCH STRATEGY AND RESULTS—IDENTIFYING RECENT**
5 **PUBLICATIONS FOR UPDATING TCDD TOXICOKINETIC MODEL INPUT**
6 **PARAMETERS**

7 The purpose of this literature search was to identify recent publications that address the
8 input parameters for the physiologically based pharmacokinetic (PBPK) models Aylward and
9 colleagues described in 2004–2005 and Emond and colleagues described in 2004–2006. This
10 literature search was part of the U.S. Environmental Protection Agency (EPA)’s preparation of a
11 response to the National Academy of Sciences’ review (*Health Risks from Dioxin and Related*
12 *Compounds: Evaluation of the EPA Reassessment*, NAS, 2006]) of EPA *Reassessment of Health*
13 *Risks From Dioxin and Related Compounds* (2003 Reassessment, U.S. EPA, 2003). English-
14 only references from 2003 to May 2009 were searched using bibliographic data bases relevant to
15 health effects and toxicology of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD). The search
16 focused on toxicokinetic data that could be used to update the dynamic disposition of
17 2,3,7,8-TCDD in mice, rats, guinea pigs, monkeys, and humans.

18 In the primary search, EPA identified 775 distinct citations based on the literature search
19 criteria described below. EPA also performed an independent supplemental search to avoid
20 missing key studies. EPA identified 28 papers for further analysis that appeared on first review
21 to report data to update the input parameters of the Aylward and Emond PBPK models;
22 considerations for selection are described in Section C.1.3.

23
24 **C.1.1. Data Bases Searched**

25 EPA used the following DIALOG bibliographic data bases in the primary search. Brief
26 descriptions of the DIALOG data bases searched are provided in Section C.1.5.

- 27
28 1. File 6: NTIS
29 2. File 41: Pollution Abstracts
30 3. File 55: Biosis
31 4. File 153: IPA Toxicology
32 5. File 155: MedLine
33 6. File 156: ToxFile

This document is a draft for review purposes only and does not constitute Agency policy.

- 1 7. File 157: Biosis Toxicology
- 2 8. File 159: CancerLit
- 3 9. File 336: RTECS
- 4

5 The PUBMED data base was used for the supplemental search.

7 **C.1.2. Literature Search Strategy and Approach**

8 The primary search used a tiered key-word approach, as documented below. The
9 principal search term was the Chemical Abstract Service Registry Number (CASRN) or specific
10 chemical name, 2,3,7,8-tetrachlorodibenzo-*p*-dioxin or 2,3,7,8-TCDD. The next tier of search
11 terms was species, and finally toxicokinetic keywords, as listed below. The period of the search
12 was 2003 through May 2009, and articles were limited to English language.

13 The supplemental PUBMED search was limited to the most recent five years (2004 to
14 present) and used four combinations of key words:

- 15
- 16 • TCDD + pharmacokinetic + humans,
- 17 • TCDD + toxicokinetic + humans,
- 18 • TCDD + pharmacokinetic + animals, and
- 19 • TCDD + toxicokinetic + animals.
- 20

21 **C.1.2.1. Chemical Search Terms—DIALOG Search**

- 22 • CASRN: 1746-01-6
- 23 • 2,3,7,8-tetrachlorodibenzo-*p*-dioxin
- 24 • 2,3,7,8-TCDD
- 25

26 **C.1.2.2. Primary Search Terms (Species)—DIALOG Search**

- 27 • Guinea pig(s)
- 28 • Human(s)
- 29 • Monkey(s)
- 30 • Mouse
- 31 • Mice

This document is a draft for review purposes only and does not constitute Agency policy.

- 1 • Rodent(s)
- 2 • Rat(s)

3

4 **C.1.2.3. Secondary Search Terms (Toxicology)—DIALOG Search**

4 specified (see search term 32)

5
6
7 **C.1.3. Citation Screening Procedures and Results**

8 Initial DIALOG searches resulted in a very large number of citation hits. Therefore,
9 some title and key word restrictions were applied iteratively to screen out less relevant citations
10 (e.g., requiring some search terms in title, requiring 2,3,7,8-TCDD rather than just TCDD).
11 Then, using reference management software, pooled information obtained from the various
12 DIALOG data bases was screened to remove duplicates. Citations then were numbered
13 sequentially (as a unique identifier). Information retrieved included the following (when
14 available): author(s), publication year, title, source document name, volume, and page numbers.

This document is a draft for review purposes only and does not constitute Agency policy.

1 The DIALOG search and duplicate removal procedure produced 775 unique citations. In
2 the next step, all 775 citations were screened for potential applicability to updating parameters in
3 the Aylward and Emond PBPK models. Of these 775 citations, 26 were selected for more
4 detailed review to determine their potential applicability, and full publications were retrieved.
5 Two citations were added from the supplemental search, giving a total of 28 articles identified
6 for further review.

7 Bibliographic information for the 28 articles selected for full review is provided in the
8 reference list at the end of this section. Table C-1 summarizes the model input parameters
9 potentially addressed by the selected articles.

10 During 2003 to May 2009, the authors of the two kinetic models under consideration
11 published several articles. For the Emond model, which was first published in 2004 (Emond et
12 al., 2004), two subsequent papers have been published (Emond et al., 2005, 2006). The Aylward
13 model, which originated from the 1995 papers by Carrier et al. (1995a, b), was later updated by
14 the same group (Aylward et al., 2004, 2005). The major change implemented in the last two
15 papers was the description of a desorption process in the digestive tract. The transfer rate
16 described is slow, but for a low body burden of TCDD, this process remains significant. This
17 concept was reported in 2002 by Moser and McLachlan (2002). The major modifications
18 expected to update the Emond model are (1) consideration of the desorption process in the
19 gastrointestinal tract and (2) rearrangement of the elimination constant, which will have a
20 negligible impact on the simulation. These changes are motivated by plausible observations
21 reported in the literature.

22 Because of the body burden found in humans and the importance of selecting an
23 appropriate dose metric in human risk assessment, the physiological model is an important tool
24 for assessing the kinetics following exposure to TCDD (Kim et al., 2003). Based on the
25 literature identified in this search, the major contributions that should be reviewed with respect to
26 the Aylward and Emond kinetic models are not modes of action or pharmacokinetic mechanisms,
27 but rather information for verifying or improving the accuracy of some model parameters.

28 Pharmacokinetics typically refers to four distinct steps including absorption, distribution,
29 metabolism, and excretion. Physiologically-based models consider each step. In the model each
30 step is parameterized to reflect better predictions of the real observations. Occasionally,
31 reviewing these models is essential to determine if any key processes or parameters might be

This document is a draft for review purposes only and does not constitute Agency policy.

1 described with better accuracy. This perspective underlies the review of the literature described
2 here. The review indicates TCDD disposition has become recognized as relatively significant
3 since the publication of the Emond and Aylward models. The literature that provides
4 information related to improving these models, however, is limited. For the benefit of this
5 exercise, EPA selected the literature that would likely contribute significantly to model response,
6 or to clarify or confirm different key issues driving the model results. Regarding the two TCDD
7 models, the two major issues that should be evaluated with respect to the recent literature
8 identified are the elimination profile and the induction of CYP1A2.

9 Reviewing the elimination variation in different species and testing variable elimination
10 with a data set appears to be appropriate. The literature reports that various factors might
11 influence elimination rate. Recent publications report the influence of diverse predictors such
12 age, body fat, or smoking habit on the elimination half-life (Milbrath et al., 2009; Kerger et al.,
13 2006, 2007). Determining whether using the Milbrath et al. information would help account for
14 intraspecies variability in elimination rate in the Emond and Aylward kinetic models would be
15 useful. In 2006, Emond et al. reviewed the influence of body fat mass and CYP1A2 induction on
16 the pharmacokinetics of TCDD. These two factors appear to contribute significantly to
17 elimination and their influences seem to be driven by TCDD body burden. Mullerova and
18 Kopecky (2007) discussed the influence of adipose tissue and the “yo-yo” effects on various
19 diseases that might be influenced by persistent organic pollutant distribution. One group
20 explored the importance of variable elimination and compared these predictions to first-order
21 elimination using the Aylward and Emond models and supported these approaches for risk
22 assessment (Heinzl et al., 2007). Two groups of authors considered a one-compartment model to
23 derive the elimination half-life (Aylward et al., 2009; Nadal et al., 2008). Comparing the
24 half-life they obtained using this approach for a range of body burden to the variable elimination
25 half-life would be interesting.

26 The second important mechanism driving the distribution and elimination of TCDD is the
27 induction of CYP1A2, identified as the major ligand protein in liver (Diliberto et al., 1997). For
28 that process, authors suggested different aspects that should be investigated, including the
29 importance of the dose metrics in the target tissue and the inducible level of CYP1A2 (Wilkes
30 et al., 2008; Staskal et al., 2005). Other papers address the intraspecies variability of lethal
31 potency in mature species versus the developing fetus (Kransler et al., 2007; Korkalainen et al.,

This document is a draft for review purposes only and does not constitute Agency policy.

1 2004). Still others point out pronounced differences among species (namely, guinea pigs,
2 hamsters, mice, and rats) (Bohonowych and Denison, 2007), as observed in studies of long-term
3 effects of low TCDD dose in liver and in studies comparing hepatic accumulation and clearance
4 of TCDD (Korenaga et al., 2007; Boverhof et al., 2005). The interspecies variation of the
5 binding affinity constant of AhR also has been reported (Connor and Aylward, 2006; Nohara
6 et al., 2006).

7 The articles identified in this literature review should be adequate to update the Aylward
8 and Emond models, which need to be evaluated according to the same structure of compartments
9 described in the literature by the two model authors.

10

1 **C.1.5. Brief Descriptions of DIALOG Bibliographic Data Bases Searched**

2 The National Technical Information Service (NTIS) database comprises summaries of
3 U.S. government-sponsored research, development, and engineering, plus analyses prepared by
4 federal agencies, their contractors, or grantees. It is the means through which unclassified,
5 publicly available, unlimited distribution reports are made available for sale from 240 agencies.
6 Additionally, some state and local government agencies contribute summaries of their reports to
7 the database. NTIS also provides access to the results of government-sponsored research and
8 development from countries outside the United States. Organizations that currently contribute to
9 the NTIS database include but are not limited to the following: the Japan Ministry of
10 International Trade and Industry (MITI); laboratories administered by the United Kingdom
11 Department of Industry; the German Federal Ministry of Research and Technology (BMFT); and
12 the French National Center for Scientific Research (CNRS).

13 Pollution Abstracts provides access to environmental information that combines
14 information on scientific research and government policies in a single resource. Topics of
15 growing concern are extensively covered from the standpoints of atmosphere, emissions,
16 mathematical models, effects on people and animals, and environmental action in response to
17 global pollution issues. This database also contains material from conference proceedings and
18 hard-to-find summarized documents along with information from primary journals in the field of
19 pollution.

20 BIOSIS Previews® contains citations from Biological Abstracts® (BA) and Biological
21 Abstracts/Reports, Reviews, and Meetings® (BA/RRM) (formerly BioResearch Index®), the
22 major publications of BIOSIS®. These publications constitute the major English-language
23 service providing comprehensive worldwide coverage of research in the biological and
24 biomedical sciences. Biological Abstracts includes approximately 350,000 accounts of original
25 research yearly from nearly 5,000 primary journal and monograph titles. BA/RRM includes an
26 additional 200,000+ citations a year from meeting abstracts, reviews, books, book chapters,
27 notes, letters, and selected reports.

This document is a draft for review purposes only and does not constitute Agency policy.

1 IPA Toxicology provides focused toxicology information on all phases of the
2 development and use of drugs and on professional pharmaceutical practice. The scope of the
3 database ranges from the clinical and practical to the theoretical aspects of toxicology literature.
4 A unique feature of abstracts reporting clinical studies is the inclusion of the study design,
5 number of patients, dosage, dosage forms, and dosage schedule.

6 Medical Literature, Analysis, and Retrieval System Online (MEDLINE®), produced by
7 the U.S. National Library of Medicine (NLM), is NLM's premier bibliographic database. It
8 contains more than 15 million references to journal articles in life sciences with a concentration
9 on biomedicine. The broad coverage of the database includes basic biomedical research and the
10 clinical sciences since 1950, including nursing, dentistry, veterinary medicine, pharmacy, allied
11 health, and pre-clinical sciences. MEDLINE® also covers life sciences that are vital to
12 biomedical practitioners, researchers, and educators, including some aspects of biology,
13 environmental science, marine biology, and plant and animal science, as well as biophysics and
14 chemistry. MEDLINE® is indexed using NLM's controlled vocabulary, Medical Subject
15 Headings (MeSH®). Approximately 400,000 records are added per year, of which more than 76
16 percent are in English. MEDLINE® contains AIDSLINE, HealthSTAR, Toxline, In Process
17 (formerly known as Pre-MEDLINE®), In Data Review, and POPLINE.

18 ToxFile covers the toxicological, pharmacological, biochemical, and physiological
19 effects of drugs and other chemicals. Adverse drug reactions, chemically induced diseases,
20 carcinogenesis, mutagenesis, teratogenesis, environmental pollution, waste disposal, radiation,
21 and food contamination are typical areas of coverage. The databases Environmental Mutagen
22 Information Center (EMIC), Developmental and Reproductive Toxicology (DART), and Toxic
23 Substances Control Act Test Submissions (TSCATS) are included in ToxFile. It is not clearly
24 stated whether the Chemical Carcinogenesis Research Information System (CCRIS), Hazardous
25 Substances Data Bank (HSDB), or Genetic Toxicology Data Bank (GENE-TOX) are included in
26 ToxFile. Consequently, a separate, on-line search was conducted to ensure that these databases
27 were searched.

28 BIOSIS® Toxicology contains citations from BA and BA/RRM (formerly BioResearch
29 Index®), the major publications of BIOSIS®, that focus on toxicology and related topics.
30 Records are drawn from journal articles, conference papers, monographs and book chapters,
31 notes, letters, and reports, as well as original research. U.S. patent records are also included.

9 C.3. TOXICOKINETIC MODELING RESULTS FOR KEY ANIMAL BIOASSAY 10 STUDIES

11 The simulated TCDD serum-adjusted lipid concentrations reported in this appendix for
12 the rodent bioassays were converted to TCDD concentrations in rodent whole blood. Initially,
13 EPA multiplied the serum-adjusted lipid concentrations by 0.0033, the ratio of lipid content to
14 total serum volume, then by 0.55, the value of the hematocrit. This product yields the TCDD
15 concentration in whole rodent blood as predicted by the PBPK model. EPA assumed that the
16 same whole blood TCDD concentration would result in the same effects in humans and rodents.

17 This conversion accomplishes the following:

18

- 19 1. Allows the human equivalent dose (HED) to be based on equivalent blood concentration
20 (that represents serum plus erythrocyte TCDD), which is proportional to tissue exposure;
- 21 2. Avoids criticism that the total blood concentration is normalized to serum lipid alone in
22 an unbalanced way (thus EPA does not contradict Centers for Disease Control and
23 Prevention (CDC) data or methods);
- 24 3. Factors out any impact of the lipid content used in the PBPK model; and
- 25 4. TCDD concentration in whole blood is encouraged for use in the assessments by the NAS
26 (NAS, 2006, p. 43); see additional information in Section 3.3.

1 **C.3.1.13. NTP (1982)—Female Rats, Chronic**

Type:	Rat	Dose:	10, 50 and 500 ng/kg/wk, two doses per week
Strain:	Osborne-Mendel	Route:	Oral gavage
Body weight	6 weeks old (BW set to 250g)	Regime:	Biweekly
Sex:	Female	Simulation time	17,976 hours (107 weeks)= (104 weeks of exposure + 3 weeks observation post-treatment)

^aThe CADM model simulates for 104 weeks only (17,472 hours). As a result, the terminal values from the CADM model are overestimated compared to the Emond model, which considered an additional 3 weeks post exposure.

1 **C.3.1.22. Toth et al., 1 Year (1979)**

Type:	Mice	Dose:	7, 700, 7000 ng/kg/week
Strain:	Swiss/H/Riop	Route:	Gastric intubation
Body weight:	10 weeks old (BW=27g)	Regime:	1/week for 52 weeks
Sex:	Female and male	Simulation time:	8,736 hours*

^aAccording to the protocol in the paper, the mice were exposed for 52 weeks. However, the post exposure treatment was for an additional 60–285 days. For this simulation, we modeled 52 weeks because we have already reached the maximum when the dosing ends. We did not simulate the scenario using the CADM model because this mice model can only simulate for a maximum of 123 days.

42 Model Descriptions for likelihoods calculated

45 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 46 $\text{Var}\{e(ij)\} = \sigma^2$
 47
 48 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 49 $\text{Var}\{e(ij)\} = \sigma(i)^2$
 50
 51 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 52 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \rho \cdot \ln(\mu(i)))$
 53 Model A3 uses any fixed variance parameters that
 54 were specified by the user
 55
 56 Model R: $Y_i = \mu + e(i)$
 57 $\text{Var}\{e(i)\} = \sigma^2$
 58
 59

60 Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-92.841935	4	193.683870
A2	-85.255316	6	182.510632
A3	-85.429148	5	180.858295
fitted	-85.605740	4	179.211479
R	-98.136607	2	200.273213

69 Explanation of Tests

1
 2 Test 1: Do responses and/or variances differ among Dose levels?
 3 (A2 vs. R)
 4 Test 2: Are Variances Homogeneous? (A1 vs A2)
 5 Test 3: Are variances adequately modeled? (A2 vs. A3)
 6 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
 7 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
 8

9 Tests of Interest

10 Test	-2*log(Likelihood Ratio)	Test df	p-value
11 Test 1	25.7626	4	<.0001
12 Test 2	15.1732	2	0.0005072
13 Test 3	0.347663	1	0.5554
14 Test 4	0.353184	1	0.5523

15
 16 The p-value for Test 1 is less than .05. There appears to be a
 17 difference between response and/or variances among the dose levels
 18 It seems appropriate to model the data
 19

20
 21 The p-value for Test 2 is less than .1. A non-homogeneous variance
 22 model appears to be appropriate
 23

24
 25 The p-value for Test 3 is greater than .1. The modeled variance appears
 26 to be appropriate here
 27

28
 29 The p-value for Test 4 is greater than .1. The model chosen seems
 30 to adequately describe the data
 31

Degrees of freedom for Test A3 vs fitted <= 0

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
-------	-----------------	-----------	-----

This document is a draft for review purposes only and does not constitute Agency policy.

1	A1	-83.696404	4	175.392808
2	A2	-73.511830	6	159.023660
3	A3	-73.530233	5	157.060467
4	fitted	-73.530233	5	157.060467
5	R	-90.294746	2	184.589492

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	33.5658	4	<.0001
Test 2	20.3691	2	<.0001
Test 3	0.0368066	1	0.8479
Test 4	0	0	NA

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

NA - Degrees of freedom for Test 4 are less than or equal to 0. The Chi-Square test for fit is not valid.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 5186.92
 BMDL = 913.947

Default Initial Parameter Values

lalpha = 6.34368
rho = 0
control = 82.1429
slope = -9.98589
power = 0.111278

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -power have been estimated at a boundary point, or have been specified by the user, and do not appear in the correlation matrix)

	lalpha	rho	control	slope
lalpha	1	-1	-0.26	0.64
rho	-1	1	0.27	-0.63
control	-0.26	0.27	1	-0.56
slope	0.64	-0.63	-0.56	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
lalpha	22.273	8.00764	6.57832	37.9677
rho	-3.90063	1.89036	-7.60567	-0.195596
control	82.1429	4.00411	74.295	89.9908
slope	-25.6494	7.11029	-39.5853	-11.7135
power	0	NA		

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

Dose	N	Obs Mean	Est Mean	Obs Std Dev	Est Std Dev	Scaled Res.
0	10	82.1	56.5	13.3	26.3	3.09
2670	10	58.1	56.5	33.9	26.3	0.195
8341	10	54.9	56.5	19.5	26.3	-0.195

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} * \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest				
Model	Log(likelihood)	# Param's	AIC	
A1	-108.574798	4	225.149597	
A2	-104.269377	6	220.538754	
A3	-105.147952	5	220.295903	
fitted	-105.759821	4	219.519641	
R	-112.382522	2	228.765045	

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A1 vs A2)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value	
Test 1	16.2263	4	0.00273	
Test 2	8.61084	2	0.0135	
Test 3	1.75715	1	0.185	
Test 4	1.22374	1	0.2686	

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Since the power was estimated to be 0, the BMD is infinite.
Setting BMD = 100*(maximum dose).

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 834064

Warning: optimum may not have been found. Bad completion code in Optimization routine.

BMDL computation failed.

33 A3	-113.009921	4	234.019841
34 fitted	-114.123097	3	234.246193
35 R	-117.976057	2	239.952114

36 Explanation of Tests
37
38 Test 1: Do responses and/or variances differ among Dose levels?
39 (A2 vs. R)
40 Test 2: Are Variances Homogeneous? (A1 vs A2)
41 Test 3: Are variances adequately modeled? (A2 vs. A3)
42 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
43 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
44

45 Tests of Interest

46 Test	47 -2*log(Likelihood Ratio)	48 Test df	49 p-value
50 Test 1	11.0943	4	0.02552
51 Test 2	1.16207	2	0.5593
52 Test 3	1.16207	2	0.5593
53 Test 4	2.22635	1	0.1357

54 The p-value for Test 1 is less than .05. There appears to be a
55 difference between response and/or variances among the dose levels
56 It seems appropriate to model the data
57
58 The p-value for Test 2 is greater than .1. A homogeneous variance
59 model appears to be appropriate here
60
61
62 The p-value for Test 3 is greater than .1. The modeled variance appears
63 to be appropriate here
64
65 The p-value for Test 4 is greater than .1. The model chosen seems
66 to adequately describe the data
67
68

```

17 Figure1-UrinaryCoproproporphyrin_3months

```

The form of the response function by Model:
Model 2:   Y[dose] = a * exp{sign * b * dose}
Model 3:   Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:   Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:   Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

26 Note: Y[dose] is the median response for exposure = dose;
 27 sign = +1 for increasing trend in data;
 28 sign = -1 for decreasing trend.

30 Model 2 is nested within Models 3 and 4.
 31 Model 3 is nested within Model 5.
 32 Model 4 is nested within Model 5.

35 Dependent variable = Mean
 36 Independent variable = Dose

This document is a draft for review purposes only and does not constitute Agency policy.

1 Data are assumed to be distributed: normally
 2 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 3 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$
 4
 5 Total number of dose groups = 4
 6 Total number of records with missing values = 0
 7 Maximum number of iterations = 250
 8 Relative Function Convergence has been set to: 1e-008

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-12.90166	5	35.80333
A2	-6.203643	8	28.40729
A3	-6.487204	6	24.97441
R	-15.73713	2	35.47427
4	-6.729565	5	23.45913

Additive constant for all log-likelihoods = -14.7. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	19.07	6	0.004052
Test 2	13.4	3	0.003854
Test 3	0.5671	2	0.7531
Test 6a	0.4847	1	0.4863

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is greater than .1. Model 4 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 294.122

BMDL = 99.3366

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-12.90166	5	35.80333
A2	-6.203643	8	28.40729
A3	-6.487204	6	24.97441
R	-15.73713	2	35.47427
5	-6.729565	5	23.45913

Additive constant for all log-likelihoods = -14.7. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	19.07	6	0.004052
Test 2	13.4	3	0.003854
Test 3	0.5671	2	0.7531
Test 7a	0.4847	1	0.4863

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is greater than .1. Model 5 seems to adequately describe the data.

9

10 Explanation of Tests

11

12

13 Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)

14

15 Test 2: Are Variances Homogeneous? (A1 vs A2)

16 Test 3: Are variances adequately modeled? (A2 vs. A3)

17 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

18 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

19

20 Tests of Interest

21

22 Test	-2*log(Likelihood Ratio)	Test df	p-value
24 Test 1	19.067	6	0.004052
25 Test 2	13.396	3	0.003854
26 Test 3	0.567122	2	0.7531
27 Test 4	-1.9007e-013	0	NA

28

29 The p-value for Test 1 is less than .05. There appears to be a
30 difference between response and/or variances among the dose levels
31 It seems appropriate to model the data

32

33 The p-value for Test 2 is less than .1. A non-homogeneous variance
34 model appears to be appropriate

35

36 The p-value for Test 3 is greater than .1. The modeled variance appears
37 to be appropriate here

38

39 NA - Degrees of freedom for Test 4 are less than or equal to 0. The Chi-Square
40 test for fit is not valid

41

Figure1-UrinaryCoproproporphyrin_3months

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean

Independent variable = Dose

The power is not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$

Total number of dose groups = 4

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

This document is a draft for review purposes only and does not constitute Agency policy.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-12.901663	5	35.803325

This document is a draft for review purposes only and does not constitute Agency policy.

1	A2	-6.203643	8	28.407287
2	A3	-6.487204	6	24.974409
3	fitted	-6.617381	5	23.234762
4	R	-15.737135	2	35.474269

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	19.067	6	0.004052
Test 2	13.396	3	0.003854
Test 3	0.567122	2	0.7531
Test 4	0.260353	1	0.6099

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 15.247
 BMDL = 2.31222e-006

=====
  
```

Table 1, dose converted to ng per kg per day

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose

This document is a draft for review purposes only and does not constitute Agency policy.

1 Data are assumed to be distributed: normally
 2 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 3 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$
 4
 5 Total number of dose groups = 4
 6 Total number of records with missing values = 0
 7 Maximum number of iterations = 250
 8 Relative Function Convergence has been set to: 1e-008
 9 Parameter Convergence has been set to: 1e-008

59 Other models for which likelihoods are calculated:

60
61 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 62 $\text{Var}\{e(ij)\} = \sigma^2$

63
64 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 65 $\text{Var}\{e(ij)\} = \sigma(i)^2$

66
67 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 68 $\text{Var}\{e(ij)\} = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$
 69
70

This document is a draft for review purposes only and does not constitute Agency policy.

1 Model R: $Y_{ij} = \mu + e(i)$
 2 $\text{Var}\{e(ij)\} = \sigma^2$
 3
 4

5 Likelihoods of Interest

6	7 Model	8 Log(likelihood)	9 DF	10 AIC
11	-----	-----	-----	-----
12	A1	-51.42175	5	112.8435
13	A2	-15.31211	8	46.62422
14	A3	-15.66963	6	43.33925
15	R	-68.75058	2	141.5012
16	2	-23.73172	4	55.46344

17 Additive constant for all log-likelihoods = -12.87. This constant added to the
 18 above values gives the log-likelihood including the term that does not
 19 depend on the model parameters.

20 Explanation of Tests

- 21 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- 22 Test 2: Are Variances Homogeneous? (A2 vs. A1)
- 23 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 24 Test 4: Does Model 2 fit the data? (A3 vs. 2)

25 Tests of Interest

26	27 Test	28 $-2*\log(\text{Likelihood Ratio})$	29 D. F.	30 p-value
31	-----	-----	-----	-----
32	Test 1	106.9	6	< 0.0001
33	Test 2	72.22	3	< 0.0001
34	Test 3	0.715	2	0.6994
35	Test 4	16.12	2	0.0003153

36 The p-value for Test 1 is less than .05. There appears to be a
 37 difference between response and/or variances among the dose
 38 levels, it seems appropriate to model the data.

39 The p-value for Test 2 is less than .1. A non-homogeneous
 40 variance model appears to be appropriate.

41 The p-value for Test 3 is greater than .1. The modeled
 42 variance appears to be appropriate here.

43 The p-value for Test 4 is less than .1. Model 2 may not adequately
 44 describe the data; you may want to consider another model.

45 Benchmark Dose Computations:

46 Specified Effect = 1.000000

47 Risk Type = Estimated standard deviations from control

48 Confidence Level = 0.950000

49 BMD = 2070.13

50 BMDL = 1521.05

51
 52

This document is a draft for review purposes only and does not constitute Agency policy.

1 3.215e+005 52.53 15.69 -0.432

5 Other models for which likelihoods are calculated:

7 Model A1: Yij = Mu(i) + e(ij)
8 Var{e(ij)} = Sigma^2

10 Model A2: Yij = Mu(i) + e(ij)
11 Var{e(ij)} = Sigma(i)^2

13 Model A3: Yij = Mu(i) + e(ij)
14 Var{e(ij)} = exp(lalpha + log(mean(i)) * rho)

16 Model R: Yij = Mu + e(i)
17 Var{e(ij)} = Sigma^2

20 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-233.0774	11	488.1549
A2	-230.2028	20	500.4056
A3	-233.0774	11	488.1549
R	-268.4038	2	540.8076
4	-234.2238	4	476.4476

31 Additive constant for all log-likelihoods = -66.16. This constant added to the
32 above values gives the log-likelihood including the term that does not
33 depend on the model parameters.

36 Explanation of Tests

- 38 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- 39 Test 2: Are Variances Homogeneous? (A2 vs. A1)
- 40 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 42 Test 6a: Does Model 4 fit the data? (A3 vs 4)

45 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	76.4	18	< 0.0001
Test 2	5.749	9	0.7647
Test 3	5.749	9	0.7647
Test 6a	2.293	7	0.9419

55 The p-value for Test 1 is less than .05. There appears to be a
56 difference between response and/or variances among the dose
57 levels, it seems appropriate to model the data.

59 The p-value for Test 2 is greater than .1. A homogeneous
60 variance model appears to be appropriate here.

62 The p-value for Test 3 is greater than .1. The modeled
63 variance appears to be appropriate here.

65 The p-value for Test 6a is greater than .1. Model 4 seems
66 to adequately describe the data.

69 Benchmark Dose Computations:

```

The form of the response function by Model:

```

Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[dose]))$
 rho is set to 0.
 A constant variance model is fit.

0

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean
 Independent variable = Dose
 rho is set to 0
 The power is not restricted
 A constant variance model is fit

Total number of dose groups = 10
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

This document is a draft for review purposes only and does not constitute Agency policy.

```

1         alpha =      276.969
2         rho =          0   Specified
3         control =     99.999
4         slope =     -0.28302
5         power =       0.42875
6

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-233.077445	11	488.154889
A2	-230.202783	20	500.405566
A3	-233.077445	11	488.154889
fitted	-241.552045	4	491.104090
R	-268.403817	2	540.807634

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	76.4021	18	<.0001
Test 2	5.74932	9	0.7647
Test 3	5.74932	9	0.7647
Test 4	16.9492	7	0.01773

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is less than .1. You may want to try a different model

Benchmark Dose Computation

Specified effect = 1
Risk Type = Estimated standard deviations from the control mean
Confidence level = 0.95
BMD = 1350.28
BMDL = 182.329

Figure 3 female only

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean

Independent variable = Dose

Power parameter restricted to be greater than 1

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \text{rho} * \ln(\text{mean}(i)))$

Total number of dose groups = 5

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

This document is a draft for review purposes only and does not constitute Agency policy.

```

1           Default Initial Parameter Values
2           lalpha =    -2.37155
3           rho =      0
4           intercept =  1.85591
5           v =        -0.507874
6           n =         0.825979
7           k =         4284.51

18 Explanation of Tests

19
20 Test 1: Do responses and/or variances differ among Dose levels?
21 (A2 vs. R)
22 Test 2: Are Variances Homogeneous? (A1 vs A2)
23 Test 3: Are variances adequately modeled? (A2 vs. A3)
24 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
25 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

26
27 Tests of Interest

28 Test	29 $-2 \cdot \log(\text{Likelihood Ratio})$	30 Test df	31 p-value
32 Test 1	80.9658	8	<.0001
33 Test 2	58.1955	4	<.0001
34 Test 3	1.84427	3	0.6053
35 Test 4	8.71916	2	0.01278

36 The p-value for Test 1 is less than .05. There appears to be a
37 difference between response and/or variances among the dose levels
38 It seems appropriate to model the data

39
40 The p-value for Test 2 is less than .1. A non-homogeneous variance
41 model appears to be appropriate

42
43 The p-value for Test 3 is greater than .1. The modeled variance appears
44 to be appropriate here

45
46 The p-value for Test 4 is less than .1. You may want to try a different
47 model

| Model  | Log(likelihood) | # Param's | AIC         |
|--------|-----------------|-----------|-------------|
| A1     | 56.758717       | 6         | -101.517434 |
| A2     | 85.856450       | 10        | -151.712901 |
| A3     | 84.934314       | 7         | -155.868628 |
| fitted | 83.472636       | 6         | -154.945271 |
| R      | 45.373551       | 2         | -86.747101  |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 80.9658                  | 8       | <.0001  |
| Test 2 | 58.1955                  | 4       | <.0001  |
| Test 3 | 1.84427                  | 3       | 0.6053  |
| Test 4 | 2.92336                  | 1       | 0.08731 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Model Descriptions for likelihoods calculated

```

57 Model A1:      Yij = Mu(i) + e(ij)
58              Var{e(ij)} = Sigma^2
59
60 Model A2:      Yij = Mu(i) + e(ij)
61              Var{e(ij)} = Sigma(i)^2
62
63 Model A3:      Yij = Mu(i) + e(ij)
64              Var{e(ij)} = exp(lalpha + rho*ln(Mu(i)))
65
66 Model A3 uses any fixed variance parameters that
67 were specified by the user

```

1 Model R:  $Y_i = \mu + e(i)$   
 2  $\text{Var}\{e(i)\} = \sigma^2$   
 3  
 4

5 Likelihoods of Interest

| 6 Model   | 7 Log(likelihood) | 8 # Param's | 9 AIC       |
|-----------|-------------------|-------------|-------------|
| 10 A1     | 56.758717         | 6           | -101.517434 |
| 11 A2     | 85.856450         | 10          | -151.712901 |
| 12 A3     | 84.934314         | 7           | -155.868628 |
| 13 fitted | 81.120729         | 5           | -152.241459 |
| 14 R      | 45.373551         | 2           | -86.747101  |

15 Explanation of Tests

- 16 Test 1: Do responses and/or variances differ among Dose levels?  
 17 (A2 vs. R)
- 18 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 19 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 20 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 21 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

22 Tests of Interest

| 23 Test   | 24 $-2*\log(\text{Likelihood Ratio})$ | 25 Test df | 26 p-value |
|-----------|---------------------------------------|------------|------------|
| 27 Test 1 | 80.9658                               | 8          | <.0001     |
| 28 Test 2 | 58.1955                               | 4          | <.0001     |
| 29 Test 3 | 1.84427                               | 3          | 0.6053     |
| 30 Test 4 | 7.62717                               | 2          | 0.02207    |

31 The p-value for Test 1 is less than .05. There appears to be a  
 32 difference between response and/or variances among the dose levels  
 33 It seems appropriate to model the data

34 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 35 model appears to be appropriate

36 The p-value for Test 3 is greater than .1. The modeled variance appears  
 37 to be appropriate here

38 The p-value for Test 4 is less than .1. You may want to try a different  
 39 model

40 Benchmark Dose Computation

41 Specified effect = 1  
 42 Risk Type = Estimated standard deviations from the control mean  
 43 Confidence level = 0.95  
 44 BMD = 247.728  
 45 BMDL = 132.818

| 0          | 16 | 1.86     | 1.57     | 0.0661      | 0.342       | 3.34        |
| 1763       | 17 | 1.58     | 1.57     | 0.185       | 0.342       | 0.0747      |
| 4944       | 15 | 1.6      | 1.57     | 0.265       | 0.342       | 0.284       |
| 1.271e+004 | 12 | 1.5      | 1.57     | 0.221       | 0.342       | -0.68       |
| 3.704e+004 | 19 | 1.35     | 1.57     | 0.515       | 0.342       | -2.85       |

55 Model Descriptions for likelihoods calculated

56  
 57  
 58 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 59  $\text{Var}\{e(ij)\} = \sigma^2$   
 60  
 61 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 62  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 63  
 64 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 65  $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
 66 Model A3 uses any fixed variance parameters that  
 67 were specified by the user  
 68  
 69 Model R:  $Y_i = \mu + e(i)$   
 70  $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC         |
|--------|-----------------|-----------|-------------|
| A1     | 56.758717       | 6         | -101.517434 |
| A2     | 85.856450       | 10        | -151.712901 |
| A3     | 84.934314       | 7         | -155.868628 |
| fitted | 45.373551       | 6         | -78.747101  |
| R      | 45.373551       | 2         | -86.747101  |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 80.9658                  | 8       | <.0001  |
| Test 2 | 58.1955                  | 4       | <.0001  |
| Test 3 | 1.84427                  | 3       | 0.6053  |
| Test 4 | 79.1215                  | 1       | <.0001  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is less than .1. You may want to try a different model

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 200720

BMDL computation failed.

17 Table 2

18 ~~~~~

```

20 The form of the response function is:
21 Y[dose] = beta_0 + beta_1*dose + beta_2*dose^2 + ...
22
23
24
25 Dependent variable = Mean
26 Independent variable = Dose
27 rho is set to 0
28 Signs of the polynomial coefficients are not restricted
29 A constant variance model is fit
30
31 Total number of dose groups = 4
32 Total number of records with missing values = 0
33 Maximum number of iterations = 250
34 Relative Function Convergence has been set to: 1e-008
35 Parameter Convergence has been set to: 1e-008
36

| 2.125e+004 | 5 | 0.296    | 0.296    | 0.074       | 0.0499      | -0.0161     |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$   
 Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | # Param's | AIC        |
|-------|-----------------|-----------|------------|
| A1    | 50.195349       | 5         | -90.390697 |
| A2    | 51.400051       | 8         | -86.800103 |
| A3    | 50.195349       | 5         | -90.390697 |

5 Explanation of Tests  
 6

7 Test 1: Do responses and/or variances differ among Dose levels?  
 8 (A2 vs. R)  
 9 Test 2: Are Variances Homogeneous? (A1 vs A2)  
 10 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 11 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
 12 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)  
 13

14 Tests of Interest  
 15

| 16 Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|-----------|--------------------------|---------|----------|
| 17 Test 1 | 20.7006                  | 6       | 0.002076 |
| 18 Test 2 | 2.40941                  | 3       | 0.4919   |
| 19 Test 3 | 2.40941                  | 3       | 0.4919   |
| 20 Test 4 | 0.462975                 | 2       | 0.7934   |

21  
 22  
 23 The p-value for Test 1 is less than .05. There appears to be a  
 24 difference between response and/or variances among the dose levels  
 25 It seems appropriate to model the data  
 26

27 The p-value for Test 2 is greater than .1. A homogeneous variance  
 28 model appears to be appropriate here  
 29

30  
 31 The p-value for Test 3 is greater than .1. The modeled variance appears  
 32 to be appropriate here  
 33

34 The p-value for Test 4 is greater than .1. The model chosen seems  
 35 to adequately describe the data  
 36  
 37

 k = 304.417

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -rho -n  
 have been estimated at a boundary point, or have been specified by  
 the user,  
 and do not appear in the correlation matrix )

|           | alpha     | intercept | v         | k        |
|-----------|-----------|-----------|-----------|----------|
| alpha     | 1         | 6.6e-010  | -7.3e-008 | 6.3e-008 |
| intercept | 6.6e-010  | 1         | -0.75     | -0.23    |
| v         | -7.3e-008 | -0.75     | 1         | -0.24    |
| k         | 6.3e-008  | -0.23     | -0.24     | 1        |

Parameter Estimates

| Interval | Variable  | Estimate | Std. Err. | 95.0% Wald Confidence |             |
|----------|-----------|----------|-----------|-----------------------|-------------|
|          |           |          |           | Lower Conf. Limit     | Upper Conf. |
| 56.6072  | alpha     | 36.1524  | 10.4363   | 15.6976               |             |
| 27.0005  | intercept | 22.1894  | 2.45468   | 17.3783               |             |
| 2.88049  | v         | -9.16864 | 3.2083    | -15.4568              | -           |
| 767.569  | n         | 1        | NA        |                       |             |
|          | k         | 178.32   | 300.643   | -410.929              |             |

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

| Dose       | N | Obs Mean | Est Mean | Obs Std Dev | Est Std Dev | Scaled Res. |
|------------|---|----------|----------|-------------|-------------|-------------|

1  
2 Model Descriptions for likelihoods calculated  
3  
4  
5 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
6  $\text{Var}\{e(ij)\} = \sigma^2$   
7  
8 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
9  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
10  
11 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
12  $\text{Var}\{e(ij)\} = \sigma^2$   
13 Model A3 uses any fixed variance parameters that  
14 were specified by the user  
15  
16 Model R:  $Y_i = \mu + e(i)$   
17  $\text{Var}\{e(i)\} = \sigma^2$   
18  
19

20 Likelihoods of Interest

| 21 Model  | 22 Log(likelihood) | 23 # Param's | 24 AIC     |
|-----------|--------------------|--------------|------------|
| 25 A1     | -55.052739         | 5            | 120.105478 |
| 26 A2     | -54.653533         | 8            | 125.307067 |
| 27 A3     | -55.052739         | 5            | 120.105478 |
| 28 fitted | -55.052919         | 4            | 118.105839 |
| 29 R      | -58.755106         | 2            | 121.510213 |

30 Explanation of Tests

31  
32 Test 1: Do responses and/or variances differ among Dose levels?  
33 (A2 vs. R)  
34 Test 2: Are Variances Homogeneous? (A1 vs A2)  
35 Test 3: Are variances adequately modeled? (A2 vs. A3)  
36 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
37 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)  
38

39 Tests of Interest

| 40 Test   | 41 $-2 \cdot \log(\text{Likelihood Ratio})$ | 42 Test df | 43 p-value |
|-----------|---------------------------------------------|------------|------------|
| 44 Test 1 | 8.20315                                     | 6          | 0.2236     |
| 45 Test 2 | 0.798411                                    | 3          | 0.8498     |
| 46 Test 3 | 0.798411                                    | 3          | 0.8498     |
| 47 Test 4 | 0.000361116                                 | 1          | 0.9848     |

48 The p-value for Test 1 is greater than .05. There may not be a  
49 difference between responses and/or variances among the dose levels  
50 Modelling the data with a dose/response curve may not be appropriate  
51

52 The p-value for Test 2 is greater than .1. A homogeneous variance  
53 model appears to be appropriate here  
54

55  
56 The p-value for Test 3 is greater than .1. The modeled variance appears  
57 to be appropriate here  
58

59 The p-value for Test 4 is greater than .1. The model chosen seems  
60 to adequately describe the data

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC         |
|--------|-----------------|-----------|-------------|
| A1     | -535.687163     | 11        | 1093.374327 |
| A2     | -496.367061     | 20        | 1032.734122 |
| A3     | -502.709623     | 12        | 1029.419246 |
| fitted | -534.909723     | 4         | 1077.819445 |
| R      | -574.835246     | 2         | 1153.670492 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 156.936                  | 18      | <.0001  |
| Test 2 | 78.6402                  | 9       | <.0001  |
| Test 3 | 12.6851                  | 8       | 0.1232  |
| Test 4 | 64.4002                  | 8       | <.0001  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

```

Figure 3: FSH in female S-D rats 24hr after dosing, 22 day old rats

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean  
 Independent variable = Dose  
 The power is not restricted  
 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

Total number of dose groups = 10  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

```

Default Initial Parameter Values
lalpha = 9.8191
rho = 0

```

1 control = 22.1591  
 2 slope = 8.17907  
 3 power = 0.293959  
 4

70 Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC         |
|--------|-----------------|-----------|-------------|
| A1     | -535.687163     | 11        | 1093.374327 |
| A2     | -496.367061     | 20        | 1032.734122 |
| A3     | -502.709623     | 12        | 1029.419246 |
| fitted | -513.735602     | 5         | 1037.471204 |
| R      | -574.835246     | 2         | 1153.670492 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 156.936                  | 18      | <.0001   |
| Test 2 | 78.6402                  | 9       | <.0001   |
| Test 3 | 12.6851                  | 8       | 0.1232   |
| Test 4 | 22.052                   | 7       | 0.002489 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Figure 3, 3-day estradiol

The form of the response function is:

1 Y[dose] = beta\_0 + beta\_1\*dose + beta\_2\*dose^2 + ...  
 2  
 3  
 4 Dependent variable = Mean  
 5 Independent variable = Dose  
 6 rho is set to 0  
 7 Signs of the polynomial coefficients are not restricted  
 8 A constant variance model is fit  
 9  
 10 Total number of dose groups = 4  
 11 Total number of records with missing values = 0  
 12 Maximum number of iterations = 250  
 13 Relative Function Convergence has been set to: 1e-008  
 14 Parameter Convergence has been set to: 1e-008  
 15  
 16  
 17

18 Default Initial Parameter Values  
 19 alpha = 267.211  
 20 rho = 0 Specified  
 21 beta\_0 = 16.1706  
 22 beta\_1 = 0.00183421  
 23  
 24

25 Asymptotic Correlation Matrix of Parameter Estimates

26  
 27 ( \*\*\* The model parameter(s) -rho  
 28 have been estimated at a boundary point, or have been specified by the user,  
 29 and do not appear in the correlation matrix )  
 30

|        | alpha    | beta_0   | beta_1   |
|--------|----------|----------|----------|
| alpha  | 1        | 2.7e-011 | 6.4e-013 |
| beta_0 | 2.7e-011 | 1        | -0.69    |
| beta_1 | 6.4e-013 | -0.69    | 1        |

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$   
Model A3 uses any fixed variance parameters that  
were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -129.653527     | 5         | 269.307054 |
| A2     | -128.294657     | 8         | 272.589314 |
| A3     | -129.653527     | 5         | 269.307054 |
| fitted | -131.476105     | 3         | 268.952210 |
| R      | -131.819169     | 2         | 267.638338 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 7.04902                  | 6       | 0.3163  |
| Test 2 | 2.71774                  | 3       | 0.4372  |
| Test 3 | 2.71774                  | 3       | 0.4372  |
| Test 4 | 3.64516                  | 2       | 0.1616  |

The p-value for Test 1 is greater than .05. There may not be a  
difference between responses and/or variances among the dose levels  
Modelling the data with a dose/response curve may not be appropriate

The p-value for Test 2 is greater than .1. A homogeneous variance  
model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears  
to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems  
to adequately describe the data

65 Model A1:  $Y_{ij} = \mu(i) + e_{ij}$   
 66  $\text{Var}\{e_{ij}\} = \sigma^2$

67 Model A2:  $Y_{ij} = \mu(i) + e_{ij}$

*This document is a draft for review purposes only and does not constitute Agency policy.*

1                   Var{e(ij)} = Sigma(i)^2  
 2  
 3   Model A3:           Yij = Mu(i) + e(ij)  
 4                   Var{e(ij)} = exp(lalpha + log(mean(i)) \* rho)  
 5  
 6   Model R:            Yij = Mu + e(i)  
 7                   Var{e(ij)} = Sigma^2  
 8  
 9

10                                           Likelihoods of Interest

| 11                   Model | 12                   Log(likelihood) | 13                   DF | 14                   AIC |
|----------------------------|--------------------------------------|-------------------------|--------------------------|
| 15                   A1    | -129.6535                            | 5                       | 269.3071                 |
| 16                   A2    | -128.2947                            | 8                       | 272.5893                 |
| 17                   A3    | -129.6535                            | 5                       | 269.3071                 |
| 18                   R     | -131.8192                            | 2                       | 267.6383                 |
| 19                   5     | -130.1062                            | 5                       | 270.2123                 |

20  
 21   Additive constant for all log-likelihoods =       -36.76. This constant added to the  
 22   above values gives the log-likelihood including the term that does not  
 23   depend on the model parameters.  
 24

25  
 26                                           Explanation of Tests

27  
 28   Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 29   Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 30   Test 3: Are variances adequately modeled? (A2 vs. A3)  
 31  
 32   Test 7a: Does Model 5 fit the data? (A3 vs 5)  
 33

34                                           Tests of Interest

| 35                   Test    | 36                   -2*log(Likelihood Ratio) | 37                   D. F. | 38                   p-value |
|------------------------------|-----------------------------------------------|----------------------------|------------------------------|
| 39                   Test 1  | 7.049                                         | 6                          | 0.3163                       |
| 40                   Test 2  | 2.718                                         | 3                          | 0.4372                       |
| 41                   Test 3  | 2.718                                         | 3                          | 0.4372                       |
| 42                   Test 7a | 0.9053                                        | 0                          | N/A                          |

43  
 44  
 45   The p-value for Test 1 is greater than .05. There may not be a  
 46   diffence between responses and/or variances among the dose levels  
 47   Modelling the data with a dose/response curve may not be appropriate.  
 48

49   The p-value for Test 2 is greater than .1. A homogeneous  
 50   variance model appears to be appropriate here.  
 51

52   The p-value for Test 3 is greater than .1. The modeled  
 53   variance appears to be appropriate here.  
 54

55   Degrees of freedom for Test 7a are less than or equal to 0.  
 56   The Chi-Square test for fit is not valid.  
 57

58  
 59   Benchmark Dose Computations:

60                   Specified Effect = 1.000000  
 61  
 62                   Risk Type = Estimated standard deviations from control  
 63  
 64                   Confidence Level = 0.950000  
 65  
 66                   BMD = Not\_Computed  
 67  
 68                   BMDL =                   0

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -129.653527     | 5         | 269.307054 |
| A2     | -128.294657     | 8         | 272.589314 |
| A3     | -129.653527     | 5         | 269.307054 |
| fitted | -130.132269     | 5         | 270.264537 |
| R      | -131.819169     | 2         | 267.638338 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 7.04902                  | 6       | 0.3163  |
| Test 2 | 2.71774                  | 3       | 0.4372  |
| Test 3 | 2.71774                  | 3       | 0.4372  |
| Test 4 | 0.957483                 | 0       | NA      |

The p-value for Test 1 is greater than .05. There may not be a difference between responses and/or variances among the dose levels. Modelling the data with a dose/response curve may not be appropriate.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

NA - Degrees of freedom for Test 4 are less than or equal to 0. The Chi-Square test for fit is not valid.

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

*This document is a draft for review purposes only and does not constitute Agency policy.*

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -129.653527     | 5         | 269.307054 |
| A2     | -128.294657     | 8         | 272.589314 |
| A3     | -129.653527     | 5         | 269.307054 |
| fitted | -130.132565     | 4         | 268.265130 |
| R      | -131.819169     | 2         | 267.638338 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 7.04902                  | 6       | 0.3163  |
| Test 2 | 2.71774                  | 3       | 0.4372  |
| Test 3 | 2.71774                  | 3       | 0.4372  |
| Test 4 | 0.958076                 | 1       | 0.3277  |

The p-value for Test 1 is greater than .05. There may not be a difference between responses and/or variances among the dose levels. Modelling the data with a dose/response curve may not be appropriate.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1  
 Risk Type = Estimated standard deviations from the control mean  
 Confidence level = 0.95  
 BMD = 5.21395e+013

BMDL computation failed.

=====  
Figure 4, 3-day progesterone  
~~~~~

The form of the response function by Model:  
 Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
 Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 4  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 2    |

Estimated Values of Interest

| Dose  | Est Mean | Est Std | Scaled Residual |
|-------|----------|---------|-----------------|
| 0     | 55.31    | 28.9    | 1.088           |
| 87.49 | 53.54    | 29.21   | -1.102          |
| 1564  | 30.93    | 34.87   | -0.314          |
| 2823  | 19.36    | 40.57   | 0.4542          |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -159.6327       | 5  | 329.2653 |
| A2    | -151.8128       | 8  | 319.6255 |
| A3    | -152.5679       | 6  | 317.1358 |
| R     | -163.9025       | 2  | 331.805  |
| 2     | -159.928        | 4  | 327.856  |

Additive constant for all log-likelihoods = -36.76. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value   |
|--------|--------------------------|-------|-----------|
| Test 1 | 24.18                    | 6     | 0.000484  |
| Test 2 | 15.64                    | 3     | 0.001344  |
| Test 3 | 1.51                     | 2     | 0.4699    |
| Test 4 | 14.72                    | 2     | 0.0006361 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 The p-value for Test 4 is less than .1. Model 2 may not adequately  
2 describe the data; you may want to consider another model.

-----

The form of the response function by Model:

- Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$
- Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$
- Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$
- Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

Note: Y[dose] is the median response for exposure = dose;  
sign = +1 for increasing trend in data;  
sign = -1 for decreasing trend.

- Model 2 is nested within Models 3 and 4.
- Model 3 is nested within Model 5.
- Model 4 is nested within Model 5.

Dependent variable = Mean  
Independent variable = Dose  
Data are assumed to be distributed: normally  
Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 4  
Total number of records with missing values = 0  
Maximum number of iterations = 250  
Relative Function Convergence has been set to: 1e-008  
Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 5    |
|----------|------------|
| lnalpha  | 15.2703    |
| rho      | -2.36741   |
| a        | 68.5132    |
| b        | 0.00136853 |
| c        | 0.350182   |
| d        | 1          |

Parameter Estimates

| 2 | 0     | 65.26 | 10.55 | -0.003266 |
| 3 | 87.49 | 32.61 | 37.4  | 0.909     |
| 4 | 1564  | 32.03 | 38.65 | -0.3733   |
| 5 | 2823  | 32.03 | 38.65 | -0.5591   |

Other models for which likelihoods are calculated:

- 11 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
12  $\text{Var}\{e(ij)\} = \sigma^2$
- 14 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
15  $\text{Var}\{e(ij)\} = \sigma(i)^2$
- 17 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
18  $\text{Var}\{e(ij)\} = \exp(\ln \alpha + \log(\text{mean}(i)) * \rho)$
- 20 Model R:  $Y_{ij} = \mu + e(i)$   
21  $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -159.6327       | 5  | 329.2653 |
| A2    | -151.8128       | 8  | 319.6255 |
| A3    | -152.5679       | 6  | 317.1358 |
| R     | -163.9025       | 2  | 331.805  |
| 5     | -152.8697       | 6  | 317.7393 |

Additive constant for all log-likelihoods = -36.76. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 24.18                    | 6     | 0.000484 |
| Test 2  | 15.64                    | 3     | 0.001344 |
| Test 3  | 1.51                     | 2     | 0.4699   |
| Test 7a | 0.6035                   | 0     | N/A      |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

Degrees of freedom for Test 7a are less than or equal to 0. The Chi-Square test for fit is not valid.

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 24.1795                  | 6       | 0.000484 |
| Test 2 | 15.6398                  | 3       | 0.001344 |
| Test 3 | 1.51027                  | 2       | 0.4699   |
| Test 4 | 0.61731                  | 0       | NA       |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

NA - Degrees of freedom for Test 4 are less than or equal to 0. The Chi-Square test for fit is not valid.

Benchmark Dose Computation

Specified effect = 1

Risk Type = Estimated standard deviations from the control mean

Confidence level = 0.95

BMD = 0.19442

Figure 4, 3-day progesterone

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean

Independent variable = Dose

The power is not restricted

The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

Total number of dose groups = 4

Total number of records with missing values = 0

Maximum number of iterations = 250

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 Relative Function Convergence has been set to: 1e-008  
 2 Parameter Convergence has been set to: 1e-008

6 Default Initial Parameter Values

7 lalpha = 7.08699  
 8 rho = 0  
 9 control = 65.2507  
 10 slope = -9.66956  
 11 power = 0.178886

14 Asymptotic Correlation Matrix of Parameter Estimates

|         | lalpha | rho   | control | slope | power |

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -159.632675     | 5         | 329.265349 |
| A2     | -151.812765     | 8         | 319.625529 |
| A3     | -152.567898     | 6         | 317.135795 |
| fitted | -152.844599     | 5         | 315.689197 |
| R      | -163.902499     | 2         | 331.804998 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 24.1795                  | 6       | 0.000484 |
| Test 2 | 15.6398                  | 3       | 0.001344 |
| Test 3 | 1.51027                  | 2       | 0.4699   |
| Test 4 | 0.553402                 | 1       | 0.4569   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

Table of Stats From Input Data

| Dose | N | Obs Mean | Obs Std Dev |
|------|---|----------|-------------|
| 0    | 7 | 13.29    | 8.65        |
| 1234 | 4 | 11.25    | 5.56        |
| 3184 | 6 | 5.75     | 3.53        |
| 8152 | 7 | 7        | 6.01        |

Estimated Values of Interest

| Dose | Est Mean | Est Std | Scaled Residual |
|------|----------|---------|-----------------|
| 0    | 12.29    | 6.145   | 0.43            |
| 1234 | 10.83    | 6.145   | 0.1359          |
| 3184 | 8.872    | 6.145   | -1.245          |
| 8152 | 5.335    | 6.145   | 0.7168          |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -54.38526       | 5  | 118.7705 |
| A2    | -51.88568       | 8  | 119.7714 |
| A3    | -54.38526       | 5  | 118.7705 |
| R     | -57.45429       | 2  | 118.9086 |
| 2     | -55.57543       | 3  | 117.1509 |

Additive constant for all log-likelihoods = -22.05. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value |

29

The p-value for Test 1 is greater than .05. There may not be a difference between responses and/or variances among the dose levels. Modelling the data with a dose/response curve may not be appropriate.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. Model 2 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 6769.45

BMDL = 2280.85

1 **E.2.23. Markowski et al. (2001): FR2 Revolutions**

2 **E.2.23.1. Summary Table of BMDS Modeling Results**

| Model <sup>a</sup>                  | Degrees of Freedom | $\chi^2$ p-Value <sup>b</sup> | AIC     | BMD (ng/kg-d) | BMDL (ng/kg-d) | Model Notes        |
|-------------------------------------|--------------------|-------------------------------|---------|---------------|----------------|--------------------|
| power, unrestricted                 | 1                  | 0.053                         | 216.124 | 1.570E+04     | 3.350E+02      | power unrestricted |

15 =====
```

16 Table 3

```
17 ~~~~~
18
19 The form of the response function by Model:
20 Model 2: Y[dose] = a * exp{sign * b * dose}
21 Model 3: Y[dose] = a * exp{sign * (b * dose)^d}
22 Model 4: Y[dose] = a * [c-(c-1) * exp{-b * dose}]
23 Model 5: Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
24
```

25 Note: Y[dose] is the median response for exposure = dose;  
26 sign = +1 for increasing trend in data;  
27 sign = -1 for decreasing trend.

28  
29 Model 2 is nested within Models 3 and 4.  
30 Model 3 is nested within Model 5.  
31 Model 4 is nested within Model 5.

```
32
33
34 Dependent variable = Mean
35 Independent variable = Dose
36 Data are assumed to be distributed: normally
37 Variance Model: exp(lnalpha +rho *ln(Y[dose]))
38 rho is set to 0.
39 A constant variance model is fit.
```

3  
4                   Likelihoods of Interest

5  
6                   Model           Log(likelihood)       DF           AIC

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -104.1655       | 5  | 218.331  |
| A2    | -101.1402       | 8  | 218.2803 |
| A3    | -104.1655       | 5  | 218.331  |
| R     | -107.5993       | 2  | 219.1985 |
| 5     | -104.2662       | 5  | 218.5323 |

7  
8  
9  
10  
11  
12  
13  
14  
15 Additive constant for all log-likelihoods =       -22.05. This constant added to the  
16 above values gives the log-likelihood including the term that does not  
17 depend on the model parameters.

18  
19  
20                   Explanation of Tests

21  
22 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
23 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
24 Test 3: Are variances adequately modeled? (A2 vs. A3)  
25  
26 Test 7a: Does Model 5 fit the data? (A3 vs 5)

27  
28  
29                   Tests of Interest

30  
31                   Test           -2\*log(Likelihood Ratio)       D. F.           p-value

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value |
|---------|--------------------------|-------|---------|
| Test 1  | 12.92                    | 6     | 0.04435 |
| Test 2  | 6.051                    | 3     | 0.1092  |
| Test 3  | 6.051                    | 3     | 0.1092  |
| Test 7a | 0.2013                   | 0     | N/A     |

32  
33  
34  
35  
36  
37  
38  
39 The p-value for Test 1 is less than .05. There appears to be a  
40 difference between response and/or variances among the dose  
41 levels, it seems appropriate to model the data.

42  
43 The p-value for Test 2 is greater than .1. A homogeneous  
44 variance model appears to be appropriate here.

45  
46 The p-value for Test 3 is greater than .1. The modeled  
47 variance appears to be appropriate here.

48  
49 Degrees of freedom for Test 7a are less than or equal to 0.  
50 The Chi-Square test for fit is not valid.

51  
52

 48 Model Descriptions for likelihoods calculated

49  
 50  
 51 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 52  $\text{Var}\{e(ij)\} = \sigma^2$   
 53

54 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 55  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 56

57 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 58  $\text{Var}\{e(ij)\} = \sigma^2$

59 Model A3 uses any fixed variance parameters that  
 60 were specified by the user  
 61

62 Model R:  $Y_i = \mu + e(i)$   
 63  $\text{Var}\{e(i)\} = \sigma^2$   
 64  
 65

66 Likelihoods of Interest

| Model | Log(likelihood) | # Param's | AIC        |
|-------|-----------------|-----------|------------|
| A1    | -104.165520     | 5         | 218.331040 |
| A2    | -101.140174     | 8         | 218.280349 |

67  
 68  
 69  
 70  
*This document is a draft for review purposes only and does not constitute Agency policy.*

|   |        |             |   |            |
|---|--------|-------------|---|------------|
| 1 | A3     | -104.165520 | 5 | 218.331040 |
| 2 | fitted | -105.148400 | 4 | 218.296799 |
| 3 | R      | -107.599268 | 2 | 219.198536 |

6 Explanation of Tests

- 7
- 8 Test 1: Do responses and/or variances differ among Dose levels?  
9 (A2 vs. R)
- 10 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 11 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 12 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 13 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

14 Tests of Interest

| 17 | Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|----|--------|--------------------------|---------|---------|
| 19 | Test 1 | 12.9182                  | 6       | 0.04435 |
| 20 | Test 2 | 6.05069                  | 3       | 0.1092  |
| 21 | Test 3 | 6.05069                  | 3       | 0.1092  |
| 22 | Test 4 | 1.96576                  | 1       | 0.1609  |

24 The p-value for Test 1 is less than .05. There appears to be a  
25 difference between response and/or variances among the dose levels  
26 It seems appropriate to model the data

27

28 The p-value for Test 2 is greater than .1. A homogeneous variance  
29 model appears to be appropriate here

30

31

32 The p-value for Test 3 is greater than .1. The modeled variance appears  
33 to be appropriate here

34

35 The p-value for Test 4 is greater than .1. The model chosen seems  
36 to adequately describe the data

37

38

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -62.013133      | 5         | 134.026266 |
| A2     | -59.839035      | 8         | 135.678070 |
| A3     | -62.013133      | 5         | 134.026266 |
| fitted | -62.016025      | 4         | 132.032049 |
| R      | -67.530040      | 2         | 139.060081 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 15.382                   | 6       | 0.01748 |
| Test 2 | 4.3482                   | 3       | 0.2262  |
| Test 3 | 4.3482                   | 3       | 0.2262  |
| Test 4 | 0.00578335               | 1       | 0.9394  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 0.1

Risk Type = Extra risk

Confidence level = 0.95

BMD = 2278.69

BMDL = 1743.86

BMDU = 2713.68

Taken together, (1743.86, 2713.68) is a 90 % two-sided confidence interval for the BMD

Model Descriptions for likelihoods calculated

```

57
58 Model A1: Yij = Mu(i) + e(ij)
59 Var{e(ij)} = Sigma^2
60
61 Model A2: Yij = Mu(i) + e(ij)
62 Var{e(ij)} = Sigma(i)^2
63
64 Model A3: Yij = Mu(i) + e(ij)
65 Var{e(ij)} = Sigma^2
66 Model A3 uses any fixed variance parameters that
67 were specified by the user
68
69 Model R: Yi = Mu + e(i)
70 Var{e(i)} = Sigma^2

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -86.449919      | 6         | 184.899838 |
| A2     | -84.654549      | 10        | 189.309098 |
| A3     | -86.449919      | 6         | 184.899838 |
| fitted | -87.793369      | 4         | 183.586738 |
| R      | -95.473923      | 2         | 194.947846 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 21.6387                  | 8       | 0.005631 |
| Test 2 | 3.59074                  | 4       | 0.4642   |
| Test 3 | 3.59074                  | 4       | 0.4642   |
| Test 4 | 2.6869                   | 2       | 0.2609   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 21.6387                  | 8       | 0.005631 |
| Test 2 | 3.59074                  | 4       | 0.4642   |
| Test 3 | 3.59074                  | 4       | 0.4642   |
| Test 4 | 2.61544                  | 1       | 0.1058   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 12.6753                  | 4       | 0.01298 |
| Test 2 | 0.676025                 | 2       | 0.7132  |
| Test 3 | 0.676025                 | 2       | 0.7132  |
| Test 4 | 1.99405                  | 1       | 0.1579  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 12.6753                  | 4       | 0.01298 |
| Test 2 | 0.676025                 | 2       | 0.7132  |
| Test 3 | 0.676025                 | 2       | 0.7132  |
| Test 4 | 1.77636e-015             | 0       | NA      |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

NA - Degrees of freedom for Test 4 are less than or equal to 0. The Chi-Square test for fit is not valid.

Benchmark Dose Computation

Specified effect = 1  
 Risk Type = Estimated standard deviations from the control mean  
 Confidence level = 0.95  
 BMD = 2017.9  
 BMDL = 8.10578e-006

Figure 4 PE9 only  
~~~~~

The form of the response function by Model:  
Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$   
Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
sign = +1 for increasing trend in data;  
sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
Model 3 is nested within Model 5.  
Model 4 is nested within Model 5.

Dependent variable = Mean  
Independent variable = Dose  
Data are assumed to be distributed: normally  
Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 5  
Total number of records with missing values = 0  
Maximum number of iterations = 250  
Relative Function Convergence has been set to: 1e-008  
Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 4     |
|----------|-------------|
| lnalpha  | 2.65881     |
| rho      | 0.913414    |
| a        | 108         |
| b        | 0.000503911 |
| c        | 0.340136    |
| d        | 1           |

Parameter Estimates

| Variable | Model 4    |
|----------|------------|
| lnalpha  | 1.66777    |
| rho      | 1.15313    |
| a        | 103.145    |
| b        | 0.00182735 |
| c        | 0.418744   |
| d        | 1          |

Table of Stats From Input Data

| Dose  | N  | Obs Mean | Obs Std Dev |
|-------|----|----------|-------------|

|-------|----------|---------|-----------------|
| 0     | 103.1    | 33.35   | -0.02732        |
| 188.3 | 85.69    | 29.96   | 0.05287         |
| 592.1 | 63.51    | 25.21   | -0.02235        |
| 2882  | 43.5     | 20.27   | 0.7167          |
| 7665  | 43.19    | 20.19   | -0.7237         |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -188.3615       | 6  | 388.7231 |
| A2    | -183.667        | 10 | 387.3339 |
| A3    | -186.1132       | 7  | 386.2263 |
| R     | -203.3606       | 2  | 410.7211 |
| 4     | -186.4844       | 5  | 382.9688 |

Additive constant for all log-likelihoods = -45.95. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 39.39                    | 8     | < 0.0001 |
| Test 2  | 9.389                    | 4     | 0.05208  |
| Test 3  | 4.892                    | 3     | 0.1798   |
| Test 6a | 0.7425                   | 2     | 0.6899   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 The p-value for Test 3 is greater than .1. The modeled  
2 variance appears to be appropriate here.

3  
4 The p-value for Test 6a is greater than .1. Model 4 seems  
5 to adequately describe the data.

34 Gnuplot Plotting File:

Figure 4 PE9 only

The form of the response function by Model:

- Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$
- Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$
- Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$
- Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

- Model 2 is nested within Models 3 and 4.
- Model 3 is nested within Model 5.
- Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 5  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Figure 4 PE9 only

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean  
Independent variable = Dose  
Power parameter is not restricted  
The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \rho * \ln(\text{mean}(i)))$   
Total number of dose groups = 5  
Total number of records with missing values = 0  
Maximum number of iterations = 250  
Relative Function Convergence has been set to: 1e-008  
Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = 6.63982  
rho = 0  
intercept = 102.857  
v = -64.2856  
n = 1.33525  
k = 461.707

Asymptotic Correlation Matrix of Parameter Estimates

|           | lalpha | rho    | intercept | v      | n      | k      |
|-----------|--------|--------|-----------|--------|--------|--------|

6 Model Descriptions for likelihoods calculated

9 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

12 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

15 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$   
 17 Model A3 uses any fixed variance parameters that  
 18 were specified by the user

20 Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

24 Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -188.361545     | 6         | 388.723090 |
| A2     | -183.666974     | 10        | 387.333947 |
| A3     | -186.113162     | 7         | 386.226325 |
| fitted | -186.121461     | 6         | 384.242922 |
| R      | -203.360558     | 2         | 410.721116 |

34 Explanation of Tests

- 36 Test 1: Do responses and/or variances differ among Dose levels?  
 37 (A2 vs. R)  
 38 Test 2: Are Variances Homogeneous? (A1 vs A2)  
 39 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 40 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
 41 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

43 Tests of Interest

| Test   | $-2 \cdot \log(\text{Likelihood Ratio})$ | Test df | p-value |
|--------|------------------------------------------|---------|---------|
| Test 1 | 39.3872                                  | 8       | <.0001  |
| Test 2 | 9.38914                                  | 4       | 0.05208 |
| Test 3 | 4.89238                                  | 3       | 0.1798  |
| Test 4 | 0.0165976                                | 1       | 0.8975  |

52 The p-value for Test 1 is less than .05. There appears to be a  
 53 difference between response and/or variances among the dose levels  
 54 It seems appropriate to model the data

56 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 57 model appears to be appropriate

59 The p-value for Test 3 is greater than .1. The modeled variance appears  
 60 to be appropriate here

62 The p-value for Test 4 is greater than .1. The model chosen seems  
 63 to adequately describe the data

~~~~~
The form of the response function is:
Y[dose] = control + slope * dose^power
Dependent variable = Mean

```

1 Independent variable = Dose  
 2 The power is not restricted  
 3 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$   
 4  
 5 Total number of dose groups = 5  
 6 Total number of records with missing values = 0  
 7 Maximum number of iterations = 250  
 8 Relative Function Convergence has been set to: 1e-008  
 9 Parameter Convergence has been set to: 1e-008

62 Model Descriptions for likelihoods calculated

63  
64  
65 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 66  $\text{Var}\{e(ij)\} = \sigma^2$

67  
68 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 69  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 70

1 Model A3:  $Y_{ij} = \mu(i) + e_{ij}$   
 2  $\text{Var}\{e_{ij}\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$   
 3 Model A3 uses any fixed variance parameters that  
 4 were specified by the user

5  
 6 Model R:  $Y_i = \mu + e(i)$   
 7  $\text{Var}\{e(i)\} = \sigma^2$   
 8  
 9

10 Likelihoods of Interest

| 11 Model  | 12 Log(likelihood) | 13 # Param's | 14 AIC     |
|-----------|--------------------|--------------|------------|
| 15 A1     | -188.361545        | 6            | 388.723090 |
| 16 A2     | -183.666974        | 10           | 387.333947 |
| 17 A3     | -186.113162        | 7            | 386.226325 |
| 18 fitted | -186.795167        | 5            | 383.590334 |
| 19 R      | -203.360558        | 2            | 410.721116 |

20 Explanation of Tests

21  
 22 Test 1: Do responses and/or variances differ among Dose levels?  
 23 (A2 vs. R)  
 24 Test 2: Are Variances Homogeneous? (A1 vs A2)  
 25 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 26 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
 27 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)  
 28

29 Tests of Interest

| 30 Test   | 31 $-2 \cdot \log(\text{Likelihood Ratio})$ | 32 Test df | 33 p-value |
|-----------|---------------------------------------------|------------|------------|
| 34 Test 1 | 39.3872                                     | 8          | <.0001     |
| 35 Test 2 | 9.38914                                     | 4          | 0.05208    |
| 36 Test 3 | 4.89238                                     | 3          | 0.1798     |
| 37 Test 4 | 1.36401                                     | 2          | 0.5056     |

38 The p-value for Test 1 is less than .05. There appears to be a  
 39 difference between response and/or variances among the dose levels  
 40 It seems appropriate to model the data

41  
 42 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 43 model appears to be appropriate

44  
 45 The p-value for Test 3 is greater than .1. The modeled variance appears  
 46 to be appropriate here

47  
 48 The p-value for Test 4 is greater than .1. The model chosen seems  
 49 to adequately describe the data

The form of the response function is:

$$Y[\text{dose}] = \text{beta}_0 + \text{beta}_1 \cdot \text{dose} + \text{beta}_2 \cdot \text{dose}^2 + \dots$$

Dependent variable = Mean

Independent variable = Dose

Signs of the polynomial coefficients are not restricted

The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) \cdot \text{rho}$

Total number of dose groups = 5

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = 12.3562  
rho = 0  
beta\_0 = 1213.22  
beta\_1 = -0.0629452

Asymptotic Correlation Matrix of Parameter Estimates

|        | lalpha | rho   | beta_0 | beta_1 |
|--------|--------|-------|--------|--------|
| lalpha | 1      | -1    | 0.081  | -0.15  |
| rho    | -1     | 1     | -0.08  | 0.15   |
| beta_0 | 0.081  | -0.08 | 1      | -0.9   |
| beta_1 | -0.15  | 0.15  | -0.9   | 1      |

Parameter Estimates

| Variable | Estimate   | Std. Err.  | 95.0% Wald Confidence Interval |                   |
|----------|------------|------------|--------------------------------|-------------------|
|          |            |            | Lower Conf. Limit              | Upper Conf. Limit |
| lalpha   | 1.72142    | 1.91282    | -2.02764                       | 5.47047           |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

1 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 2  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 3  
 4 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 5  $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$   
 6 Model A3 uses any fixed variance parameters that  
 7 were specified by the user  
 8  
 9 Model R:  $Y_i = \mu + e(i)$   
 10  $\text{Var}\{e(i)\} = \sigma^2$   
 11  
 12

13 Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -444.832859     | 6         | 901.665718 |
| A2     | -425.402825     | 10        | 870.805651 |
| A3     | -435.489363     | 7         | 884.978727 |
| fitted | -440.330158     | 4         | 888.660316 |
| R      | -463.753685     | 2         | 931.507371 |

23 Explanation of Tests

24  
 25 Test 1: Do responses and/or variances differ among Dose levels?  
 26 (A2 vs. R)  
 27 Test 2: Are Variances Homogeneous? (A1 vs A2)  
 28 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 29 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
 30 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)  
 31

32 Tests of Interest

| Test   | $-2 \cdot \log(\text{Likelihood Ratio})$ | Test df | p-value   |
|--------|------------------------------------------|---------|-----------|
| Test 1 | 76.7017                                  | 8       | <.0001    |
| Test 2 | 38.8601                                  | 4       | <.0001    |
| Test 3 | 20.1731                                  | 3       | 0.0001563 |
| Test 4 | 9.68159                                  | 3       | 0.02148   |

41 The p-value for Test 1 is less than .05. There appears to be a  
 42 difference between response and/or variances among the dose levels  
 43 It seems appropriate to model the data  
 44

45 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 46 model appears to be appropriate  
 47

48 The p-value for Test 3 is less than .1. You may want to consider a  
 49 different variance model  
 50

51 The p-value for Test 4 is less than .1. You may want to try a different  
 52 model  
 53

$$\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$$

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -444.8329       | 6  | 901.6657 |
| A2    | -425.4028       | 10 | 870.8057 |
| A3    | -435.4894       | 7  | 884.9787 |
| R     | -463.7537       | 2  | 931.5074 |
| 5     | -440.8331       | 5  | 891.6662 |

Additive constant for all log-likelihoods = -61.57. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value   |
|---------|--------------------------|-------|-----------|
| Test 1  | 76.7                     | 8     | < 0.0001  |
| Test 2  | 38.86                    | 4     | < 0.0001  |
| Test 3  | 20.17                    | 3     | 0.0001563 |
| Test 7a | 10.69                    | 2     | 0.004778  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 8379.86

BMDL = 5143.92

52 Model Descriptions for likelihoods calculated

55 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 56  $\text{Var}\{e(ij)\} = \sigma^2$   
 57  
 58 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 59  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 60  
 61 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 62  $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
 63 Model A3 uses any fixed variance parameters that  
 64 were specified by the user  
 65  
 66 Model R:  $Y_i = \mu + e(i)$   
 67  $\text{Var}\{e(i)\} = \sigma^2$   
 68  
 69  
 70

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -444.832859     | 6         | 901.665718 |
| A2     | -425.402825     | 10        | 870.805651 |
| A3     | -435.489363     | 7         | 884.978727 |
| fitted | -439.536553     | 6         | 891.073107 |
| R      | -463.753685     | 2         | 931.507371 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value   |
|--------|--------------------------|---------|-----------|
| Test 1 | 76.7017                  | 8       | <.0001    |
| Test 2 | 38.8601                  | 4       | <.0001    |
| Test 3 | 20.1731                  | 3       | 0.0001563 |
| Test 4 | 8.09438                  | 1       | 0.00444   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Specified effect = 1  
 Risk Type = Estimated standard deviations from the control mean  
 Confidence level = 0.95  
 BMD = 6049.74

BMDL computation failed.

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean

Independent variable = Dose

The power is not restricted

The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$

Total number of dose groups = 5

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | # Param's | AIC |
|-------|-----------------|-----------|-----|
|-------|-----------------|-----------|-----|

*This document is a draft for review purposes only and does not constitute Agency policy.*

|   |        |             |    |            |
|---|--------|-------------|----|------------|
| 1 | A1     | -444.832859 | 6  | 901.665718 |
| 2 | A2     | -425.402825 | 10 | 870.805651 |
| 3 | A3     | -435.489363 | 7  | 884.978727 |
| 4 | fitted | -439.417961 | 5  | 888.835922 |
| 5 | R      | -463.753685 | 2  | 931.507371 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value   |
|--------|--------------------------|---------|-----------|
| Test 1 | 76.7017                  | 8       | <.0001    |
| Test 2 | 38.8601                  | 4       | <.0001    |
| Test 3 | 20.1731                  | 3       | 0.0001563 |
| Test 4 | 7.85719                  | 2       | 0.01967   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

 64 Model Descriptions for likelihoods calculated

65  
 66  
 67 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 68  $\text{Var}\{e(ij)\} = \sigma^2$   
 69

70 Model A2:  $Y_{ij} = \mu(i) + e(ij)$

*This document is a draft for review purposes only and does not constitute Agency policy.*

1                   Var{e(ij)} = Sigma(i)^2  
2  
3 Model A3:            Yij = Mu(i) + e(ij)  
4                    Var{e(ij)} = exp(lalpha + rho\*ln(Mu(i)))  
5            Model A3 uses any fixed variance parameters that  
6            were specified by the user  
7  
8 Model R:            Yi = Mu + e(i)  
9                    Var{e(i)} = Sigma^2  
10  
11  
12                               Likelihoods of Interest  
13  
14            Model        Log(likelihood)   # Param's        AIC  
15            A1           -190.565019       6            393.130038  
16            A2           -181.476284       10           382.952569  
17            A3           -181.900030       7            377.800059  
18            fitted       -184.760998       4            377.521996  
19            R            -204.636496       2            413.272993

21  
22                               Explanation of Tests  
23

24 Test 1: Do responses and/or variances differ among Dose levels?  
25        (A2 vs. R)  
26 Test 2: Are Variances Homogeneous? (A1 vs A2)  
27 Test 3: Are variances adequately modeled? (A2 vs. A3)  
28 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
29 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)  
30

31                               Tests of Interest  
32

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 46.3204                  | 8       | <.0001   |
| Test 2 | 18.1775                  | 4       | 0.001139 |
| Test 3 | 0.84749                  | 3       | 0.8381   |
| Test 4 | 5.72194                  | 3       | 0.126    |

40 The p-value for Test 1 is less than .05. There appears to be a  
41 difference between response and/or variances among the dose levels  
42 It seems appropriate to model the data  
43

44 The p-value for Test 2 is less than .1. A non-homogeneous variance  
45 model appears to be appropriate  
46

47 The p-value for Test 3 is greater than .1. The modeled variance appears  
48 to be appropriate here  
49

50 The p-value for Test 4 is greater than .1. The model chosen seems  
51 to adequately describe the data  
52

17 Anti Response to SRBCs - PFC x 10 to the 4 per spleen, Table 4  
 18 ~~~~~

19  
 20 The form of the response function by Model:  
 21 Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
 22 Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
 23 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$   
 24 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$   
 25

26 Note: Y[dose] is the median response for exposure = dose;  
 27 sign = +1 for increasing trend in data;  
 28 sign = -1 for decreasing trend.  
 29

30 Model 2 is nested within Models 3 and 4.  
 31 Model 3 is nested within Model 5.  
 32 Model 4 is nested within Model 5.  
 33

34  
 35 Dependent variable = Mean  
 36 Independent variable = Dose

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 Data are assumed to be distributed: normally  
 2 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 3 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i))) * \rho$   
 4  
 5 Total number of dose groups = 5  
 6 Total number of records with missing values = 0  
 7 Maximum number of iterations = 250  
 8 Relative Function Convergence has been set to: 1e-008  
 9 Parameter Convergence has been set to: 1e-008

10 MLE solution provided: Exact

| 7385       | 11.68    | 7.807   | 0.4578          |
| 1.744e+004 | 3.2      | 3.04    | -0.1864         |

62 Other models for which likelihoods are calculated:

64 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 65  $\text{Var}\{e(ij)\} = \sigma^2$

67 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 68  $\text{Var}\{e(ij)\} = \sigma(i)^2$

70 Model A3:  $Y_{ij} = \mu(i) + e(ij)$

$$\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$$

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -190.565        | 6  | 393.13   |
| A2    | -181.4763       | 10 | 382.9526 |
| A3    | -181.9          | 7  | 377.8001 |
| R     | -204.6365       | 2  | 413.273  |
| 5     | -184.5689       | 6  | 381.1378 |

Additive constant for all log-likelihoods = -61.57. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 46.32                    | 8     | < 0.0001 |
| Test 2  | 18.18                    | 4     | 0.001139 |
| Test 3  | 0.8475                   | 3     | 0.8381   |
| Test 7a | 5.338                    | 1     | 0.02087  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Likelihoods of Interest

*This document is a draft for review purposes only and does not constitute Agency policy.*

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -190.565019     | 6         | 393.130038 |
| A2     | -181.476284     | 10        | 382.952569 |
| A3     | -181.900030     | 7         | 377.800059 |
| fitted | -183.230840     | 6         | 378.461681 |
| R      | -204.636496     | 2         | 413.272993 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 46.3204                  | 8       | <.0001   |
| Test 2 | 18.1775                  | 4       | 0.001139 |
| Test 3 | 0.84749                  | 3       | 0.8381   |
| Test 4 | 2.66162                  | 1       | 0.1028   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model      Log(likelihood)      # Param's      AIC

*This document is a draft for review purposes only and does not constitute Agency policy.*

|   |        |             |    |            |
|---|--------|-------------|----|------------|
| 1 | A1     | -190.565019 | 6  | 393.130038 |
| 2 | A2     | -181.476284 | 10 | 382.952569 |
| 3 | A3     | -181.900030 | 7  | 377.800059 |
| 4 | fitted | -183.210067 | 5  | 376.420134 |
| 5 | R      | -204.636496 | 2  | 413.272993 |

8 Explanation of Tests

- 9
- 10 Test 1: Do responses and/or variances differ among Dose levels?  
 11 (A2 vs. R)
- 12 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 13 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 14 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 15 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

17 Tests of Interest

| 18 | Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|----|--------|--------------------------|---------|----------|
| 21 | Test 1 | 46.3204                  | 8       | <.0001   |
| 22 | Test 2 | 18.1775                  | 4       | 0.001139 |
| 23 | Test 3 | 0.84749                  | 3       | 0.8381   |
| 24 | Test 4 | 2.62008                  | 2       | 0.2698   |

26 The p-value for Test 1 is less than .05. There appears to be a  
 27 difference between response and/or variances among the dose levels  
 28 It seems appropriate to model the data

30 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 31 model appears to be appropriate

33 The p-value for Test 3 is greater than .1. The modeled variance appears  
 34 to be appropriate here

36 The p-value for Test 4 is greater than .1. The model chosen seems  
 37 to adequately describe the data

40 Benchmark Dose Computation

41 Specified effect = 1

44 Risk Type = Estimated standard deviations from the control mean

46 Confidence level = 0.95

48 BMD = 6542.48

51 BMDL = 2072.46

Table 2

The form of the probability function is:

$$P[\text{response}] = \text{background} + (1 - \text{background}) / [1 + \text{EXP}(-\text{intercept} - \text{slope} * \text{Log}(\text{dose}))]$$

Dependent variable = DichEff

Independent variable = Dose

Slope parameter is restricted as slope  $\geq 1$

Total number of observations = 4

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

```

Tbl3, hepatic retinol

~~~~~

```

The form of the response function by Model:
Model 2:   Y[dose] = a * exp{sign * b * dose}
Model 3:   Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:   Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:   Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

```

Note: Y[dose] is the median response for exposure = dose;
      sign = +1 for increasing trend in data;
      sign = -1 for decreasing trend.
  
```

```

      Model 2 is nested within Models 3 and 4.
      Model 3 is nested within Model 5.
      Model 4 is nested within Model 5.
  
```

```

Dependent variable = Mean
Independent variable = Dose
  
```

This document is a draft for review purposes only and does not constitute Agency policy.

1 Data are assumed to be distributed: normally
 2 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 3 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$
 4
 5 Total number of dose groups = 6
 6 Total number of records with missing values = 0
 7 Maximum number of iterations = 250
 8 Relative Function Convergence has been set to: 1e-008
 9 Parameter Convergence has been set to: 1e-008

7

8
9 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-87.1567	7	188.3134
A2	-47.28742	12	118.5748
A3	-55.32422	8	126.6484
R	-109.967	2	223.934
5	-65.72639	5	141.4528

10
11
12
13
14
15
16
17
18
19
20 Additive constant for all log-likelihoods = -44.11. This constant added to the
21 above values gives the log-likelihood including the term that does not
22 depend on the model parameters.
23

24
25 Explanation of Tests

26
27 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
28 Test 2: Are Variances Homogeneous? (A2 vs. A1)
29 Test 3: Are variances adequately modeled? (A2 vs. A3)
30
31 Test 7a: Does Model 5 fit the data? (A3 vs 5)
32
33

34 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	125.4	10	< 0.0001
Test 2	79.74	5	< 0.0001
Test 3	16.07	4	0.002922
Test 7a	20.8	3	0.0001156

35
36
37
38
39
40
41
42
43
44 The p-value for Test 1 is less than .05. There appears to be a
45 difference between response and/or variances among the dose
46 levels, it seems appropriate to model the data.
47

48 The p-value for Test 2 is less than .1. A non-homogeneous
49 variance model appears to be appropriate.
50

51 The p-value for Test 3 is less than .1. You may want to
52 consider a different variance model.
53

54 The p-value for Test 7a is less than .1. Model 5 may not adequately
55 describe the data; you may want to consider another model.
56

57
58 Benchmark Dose Computations:

59 Specified Effect = 1.000000

60 Risk Type = Estimated standard deviations from control

61 Confidence Level = 0.950000

62 BMD = 13706.9

63

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-87.156698	7	188.313395
A2	-47.287416	12	118.574833
A3	-55.324218	8	126.648436
fitted	-56.747514	6	125.495027
R	-109.967018	2	223.934036

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	125.359	10	<.0001
Test 2	79.7386	5	<.0001
Test 3	16.0736	4	0.002922
Test 4	2.84659	2	0.2409

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1
Risk Type = Estimated standard deviations from the control mean
Confidence level = 0.95
BMD = 1980.88

BMDL computation failed.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-87.156698	7	188.313395
A2	-47.287416	12	118.574833
A3	-55.324218	8	126.648436
fitted	-60.885852	5	131.771704
R	-109.967018	2	223.934036

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	125.359	10	<.0001
Test 2	79.7386	5	<.0001
Test 3	16.0736	4	0.002922
Test 4	11.1233	3	0.01108

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 209.498
 BMDL = 7.67456

1.378e+005	3.013	2.721	-0.01317

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-250.5548	7	515.1096
A2	-196.7557	12	417.5115
A3	-197.3832	8	410.7663
R	-276.7896	2	557.5793
4	-218.4969	5	446.9938

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	160.1	10	< 0.0001
Test 2	107.6	5	< 0.0001
Test 3	1.255	4	0.869
Test 6a	42.23	3	< 0.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled

This document is a draft for review purposes only and does not constitute Agency policy.

1 variance appears to be appropriate here.

2
3 The p-value for Test 6a is less than .1. Model 4 may not adequately
4 describe the data; you may want to consider another model.

1 =====
2
3 Tbl3, hepatic retinol palmitate
4 ~~~~~
5
6 The form of the response function by Model:
7 Model 2: Y[dose] = a * exp{sign * b * dose}
8 Model 3: Y[dose] = a * exp{sign * (b * dose)^d}
9 Model 4: Y[dose] = a * [c-(c-1) * exp{-b * dose}]
10 Model 5: Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
11
12 Note: Y[dose] is the median response for exposure = dose;
13 sign = +1 for increasing trend in data;
14 sign = -1 for decreasing trend.
15
16 Model 2 is nested within Models 3 and 4.
17 Model 3 is nested within Model 5.
18 Model 4 is nested within Model 5.
19
20
21 Dependent variable = Mean
22 Independent variable = Dose
23 Data are assumed to be distributed: normally
24 Variance Model: exp(lnalpha +rho *ln(Y[dose]))
25 The variance is to be modeled as Var(i) = exp(lalpha + log(mean(i)) * rho)
26
27 Total number of dose groups = 6
28 Total number of records with missing values = 0
29 Maximum number of iterations = 250
30 Relative Function Convergence has been set to: 1e-008
31 Parameter Convergence has been set to: 1e-008
32

```

17 Other models for which likelihoods are calculated:

20 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 21 $\text{Var}\{e(ij)\} = \sigma^2$
 22
 23 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 24 $\text{Var}\{e(ij)\} = \sigma(i)^2$
 25
 26 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 27 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
 28
 29 Model R: $Y_{ij} = \mu + e(i)$
 30 $\text{Var}\{e(ij)\} = \sigma^2$
 31

33 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-250.5548	7	515.1096
A2	-196.7557	12	417.5115
A3	-197.3832	8	410.7663
R	-276.7896	2	557.5793
5	-218.4969	5	446.9938

44 Additive constant for all log-likelihoods = -44.11. This constant added to the
 45 above values gives the log-likelihood including the term that does not
 46 depend on the model parameters.

49 Explanation of Tests

51 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 52 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 53 Test 3: Are variances adequately modeled? (A2 vs. A3)
 54
 55 Test 7a: Does Model 5 fit the data? (A3 vs 5)

58 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	160.1	10	< 0.0001
Test 2	107.6	5	< 0.0001
Test 3	1.255	4	0.869
Test 7a	42.23	3	< 0.0001

68 The p-value for Test 1 is less than .05. There appears to be a
 69 difference between response and/or variances among the dose
 70 levels, it seems appropriate to model the data.

This document is a draft for review purposes only and does not constitute Agency policy.

1
2 The p-value for Test 2 is less than .1. A non-homogeneous
3 variance model appears to be appropriate.

4
5 The p-value for Test 3 is greater than .1. The modeled
6 variance appears to be appropriate here.

7
8 The p-value for Test 7a is less than .1. Model 5 may not adequately
9 describe the data; you may want to consider another model.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-250.554817	7	515.109634
A2	-196.755746	12	417.511491
A3	-197.383174	8	410.766347
fitted	-257.680271	5	525.360542
R	-276.789644	2	557.579287

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	160.068	10	<.0001
Test 2	107.598	5	<.0001
Test 3	1.25486	4	0.869
Test 4	120.594	3	<.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears

This document is a draft for review purposes only and does not constitute Agency policy.

1 to be appropriate here
 2
 3 The p-value for Test 4 is less than .1. You may want to try a different
 4 model

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -250.554817     | 7         | 515.109634 |
| A2     | -196.755746     | 12        | 417.511491 |
| A3     | -197.383174     | 8         | 410.766347 |
| fitted | -199.490894     | 5         | 408.981788 |
| R      | -276.789644     | 2         | 557.579287 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 160.068                  | 10      | <.0001  |
| Test 2 | 107.598                  | 5       | <.0001  |
| Test 3 | 1.25486                  | 4       | 0.869   |
| Test 4 | 4.21544                  | 3       | 0.2391  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Exponential Model. (Version: 1.5; Date: 4/23/2009)
Input Data File: C:\USEPA\BMDS21\Nov20\Blood\Exp_BMR1_plasma_FT4.(d)
Gnuplot Plotting File:
                                           Fri Nov 20 12:30:05 2009
=====

```

Tbl3, plasma FT4

```

The form of the response function by Model:
Model 2:      Y[dose] = a * exp{sign * b * dose}
Model 3:      Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:      Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:      Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[dose]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 2      |
|----------|--------------|
| lnalpha  | 4.29134      |
| rho      | -0.423761    |
| a        | 25.725       |
| b        | 2.47112e-005 |
| c        | 0.381323     |
| d        | 1            |

Parameter Estimates

| Variable | Model 2      |
|----------|--------------|
| lnalpha  | 1.7323       |

Table of Stats From Input Data

| Dose       | N | Obs Mean | Obs Std Dev |
|------------|---|----------|-------------|
| 0          | 8 | 23.4     | 3.111       |
| 3969       | 8 | 24.5     | 5.657       |
| 6479       | 8 | 22.4     | 2.828       |
| 9968       | 8 | 19.3     | 9.334       |
| 4.761e+004 | 8 | 16.3     | 4.243       |
| 1.378e+005 | 8 | 10.3     | 4.808       |

Estimated Values of Interest

| Dose       | Est Mean | Est Std | Scaled Residual |
|------------|----------|---------|-----------------|
| 0          | 23.03    | 5.531   | 0.1896          |
| 3969       | 22.47    | 5.496   | 1.046           |
| 6479       | 22.12    | 5.474   | 0.1445          |
| 9968       | 21.65    | 5.444   | -1.219          |
| 4.761e+004 | 17.13    | 5.13    | -0.4583         |
| 1.378e+005 | 9.779    | 4.447   | 0.3314          |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\lambda\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -102.145        | 7  | 218.2901 |
| A2    | -94.04963       | 12 | 212.0993 |
| A3    | -102.143        | 8  | 220.286  |
| R     | -117.8175       | 2  | 239.635  |
| 2     | -103.491        | 4  | 214.9821 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value  |
|--------|--------------------------|-------|----------|
| Test 1 | 47.54                    | 10    | < 0.0001 |

*This document is a draft for review purposes only and does not constitute Agency policy.*

|   |        |       |   |          |
|---|--------|-------|---|----------|
| 1 | Test 2 | 16.19 | 5 | 0.00632  |
| 2 | Test 3 | 16.19 | 4 | 0.002778 |
| 3 | Test 4 | 2.696 | 4 | 0.6099   |

6 The p-value for Test 1 is less than .05. There appears to be a  
7 difference between response and/or variances among the dose  
8 levels, it seems appropriate to model the data.

10 The p-value for Test 2 is less than .1. A non-homogeneous  
11 variance model appears to be appropriate.

13 The p-value for Test 3 is less than .1. You may want to  
14 consider a different variance model.

16 The p-value for Test 4 is greater than .1. Model 2 seems  
17 to adequately describe the data.

20 Benchmark Dose Computations:

22 Specified Effect = 1.000000

24 Risk Type = Estimated standard deviations from control

26 Confidence Level = 0.950000

28 BMD = 44193.5

30 BMDL = 28156.1

Exponential Model. (Version: 1.5; Date: 4/23/2009)
Input Data File: C:\USEPA\BMDS21\Nov20\Blood\Exp_Unrest_BMR1_plasma_FT4.(d)
Gnuplot Plotting File:
                                           Fri Nov 20 12:30:11 2009
=====

```

Tbl3, plasma FT4

```

The form of the response function by Model:
Model 2:   Y[dose] = a * exp{sign * b * dose}
Model 3:   Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:   Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:   Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[dose]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 5      |
|----------|--------------|
| lnalpha  | 4.29134      |
| rho      | -0.423761    |

Table of Stats From Input Data

| Dose       | N | Obs Mean | Obs Std Dev |
|------------|---|----------|-------------|
| 0          | 8 | 23.4     | 3.111       |
| 3969       | 8 | 24.5     | 5.657       |
| 6479       | 8 | 22.4     | 2.828       |
| 9968       | 8 | 19.3     | 9.334       |
| 4.761e+004 | 8 | 16.3     | 4.243       |
| 1.378e+005 | 8 | 10.3     | 4.808       |

Estimated Values of Interest

| Dose       | Est Mean | Est Std | Scaled Residual |
|------------|----------|---------|-----------------|
| 0          | 23.6     | 5.537   | -0.1009         |
| 3969       | 22.72    | 5.481   | 0.9194          |
| 6479       | 22.19    | 5.446   | 0.1096          |
| 9968       | 21.49    | 5.4     | -1.145          |
| 4.761e+004 | 15.85    | 4.978   | 0.2575          |
| 1.378e+005 | 10.36    | 4.443   | -0.03965        |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\lambda\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -102.145        | 7  | 218.2901 |
| A2    | -94.04963       | 12 | 212.0993 |
| A3    | -102.143        | 8  | 220.286  |
| R     | -117.8175       | 2  | 239.635  |
| 5     | -103.1224       | 5  | 216.2449 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test | -2*log(Likelihood Ratio) | D. F. | p-value |
|------|--------------------------|-------|---------|
|------|--------------------------|-------|---------|

*This document is a draft for review purposes only and does not constitute Agency policy.*

|   |         |       |    |          |
|---|---------|-------|----|----------|
| 1 | Test 1  | 47.54 | 10 | < 0.0001 |
| 2 | Test 2  | 16.19 | 5  | 0.00632  |
| 3 | Test 3  | 16.19 | 4  | 0.002778 |
| 4 | Test 7a | 1.959 | 3  | 0.581    |

7 The p-value for Test 1 is less than .05. There appears to be a  
8 difference between response and/or variances among the dose  
9 levels, it seems appropriate to model the data.

11 The p-value for Test 2 is less than .1. A non-homogeneous  
12 variance model appears to be appropriate.

14 The p-value for Test 3 is less than .1. You may want to  
15 consider a different variance model.

17 The p-value for Test 7a is greater than .1. Model 5 seems  
18 to adequately describe the data.

21 Benchmark Dose Computations:

22 Specified Effect = 1.000000

25 Risk Type = Estimated standard deviations from control

27 Confidence Level = 0.950000

29 BMD = 30208.5

31 BMDL = 12273.2

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -102.145036     | 7         | 218.290071 |
| A2     | -94.049629      | 12        | 212.099258 |
| A3     | -102.143023     | 8         | 220.286046 |
| fitted | -103.295375     | 5         | 216.590750 |
| R      | -117.817514     | 2         | 239.635028 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | $-2 \cdot \log(\text{Likelihood Ratio})$ | Test df | p-value  |
|--------|------------------------------------------|---------|----------|
| Test 1 | 47.5358                                  | 10      | <.0001   |
| Test 2 | 16.1908                                  | 5       | 0.00632  |
| Test 3 | 16.1868                                  | 4       | 0.002778 |
| Test 4 | 2.3047                                   | 3       | 0.5116   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 29513.9

BMDL = 7158.08

## E.2.49. Van Birgelen et al. (1995a): Plasma TT4

### E.2.49.1. Summary Table of BMDS Modeling Results

| Model                               | Degrees of Freedom | Variance $p$ -Value <sup>a</sup> | $\chi^2$ Test Statistic | $\chi^2$ $p$ -Value <sup>b</sup> | AIC           | BMD (ng/kg-d)  | BMDL (ng/kg-d) | Model Notes                                                    |
|-------------------------------------|--------------------|----------------------------------|-------------------------|----------------------------------|---------------|----------------|----------------|----------------------------------------------------------------|

 17 ~~~~~

18  
 19  
 20 The form of the response function by Model:  
 21 Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
 22 Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
 23 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$   
 24 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

25  
 26 Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 27 sign = +1 for increasing trend in data;  
 28 sign = -1 for decreasing trend.

29  
 30 Model 2 is nested within Models 3 and 4.  
 31 Model 3 is nested within Model 5.  
 32 Model 4 is nested within Model 5.

33  
 34  
 35 Dependent variable = Mean  
 36 Independent variable = Dose

Model A2:             $Y_{ij} = \mu(i) + e(ij)$   
                       $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:             $Y_{ij} = \mu(i) + e(ij)$   
                       $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R:              $Y_{ij} = \mu + e(i)$   
                       $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -112.0125       | 7  | 238.025  |
| A2    | -111.4015       | 12 | 246.8029 |
| A3    | -112.0125       | 7  | 238.025  |
| R     | -127.4455       | 2  | 258.891  |
| 2     | -116.6748       | 3  | 239.3495 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value   |
|--------|--------------------------|-------|-----------|
| Test 1 | 32.09                    | 10    | 0.0003871 |
| Test 2 | 1.222                    | 5     | 0.9427    |
| Test 3 | 1.222                    | 5     | 0.9427    |
| Test 4 | 9.325                    | 4     | 0.05348   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. Model 2 may not adequately describe the data; you may want to consider another model.

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -112.0125       | 7  | 238.025  |
| A2    | -111.4015       | 12 | 246.8029 |
| A3    | -112.0125       | 7  | 238.025  |
| R     | -127.4455       | 2  | 258.891  |
| 5     | -116.3891       | 4  | 240.7782 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value   |
|---------|--------------------------|-------|-----------|
| Test 1  | 32.09                    | 10    | 0.0003871 |
| Test 2  | 1.222                    | 5     | 0.9427    |
| Test 3  | 1.222                    | 5     | 0.9427    |
| Test 7a | 8.753                    | 3     | 0.03276   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

18
19     Explanation of Tests
20
21     Test 1: Do responses and/or variances differ among Dose levels?
22             (A2 vs. R)
23     Test 2: Are Variances Homogeneous? (A1 vs A2)
24     Test 3: Are variances adequately modeled? (A2 vs. A3)
25     Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
26     (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
27
28     Tests of Interest
29
30     Test      -2*log(Likelihood Ratio)  Test df      p-value
31
32     Test 1           32.088             10          0.0003871
33     Test 2           1.22208            5           0.9427
34     Test 3           1.22208            5           0.9427
35     Test 4           6.30697            3           0.09759
36
37     The p-value for Test 1 is less than .05. There appears to be a
38     difference between response and/or variances among the dose levels
39     It seems appropriate to model the data
40
41     The p-value for Test 2 is greater than .1. A homogeneous variance
42     model appears to be appropriate here
43
44
45     The p-value for Test 3 is greater than .1. The modeled variance appears
46     to be appropriate here
47
48     The p-value for Test 4 is less than .1. You may want to try a different
49     model

 70

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -112.012501     | 7         | 238.025002 |
| A2     | -111.401462     | 12        | 246.802924 |
| A3     | -112.012501     | 7         | 238.025002 |
| fitted | -116.119011     | 4         | 240.238023 |
| R      | -127.445484     | 2         | 258.890968 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value   |
|--------|--------------------------|---------|-----------|
| Test 1 | 32.088                   | 10      | 0.0003871 |
| Test 2 | 1.22208                  | 5       | 0.9427    |
| Test 3 | 1.22208                  | 5       | 0.9427    |
| Test 4 | 8.21302                  | 3       | 0.04181   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is less than .1. You may want to try a different model

The form of the response function is:

Y[dose] = intercept + v*dose^n/(k^n + dose^n)

Dependent variable = Mean
Independent variable = Dose
Power parameter restricted to be greater than 1
The variance is to be modeled as Var(i) = exp(lalpha + rho * ln(mean(i)))

Total number of dose groups = 7
Total number of records with missing values = 0
Maximum number of iterations = 250
Relative Function Convergence has been set to: 1e-008
Parameter Convergence has been set to: 1e-008

```

```

| 2250       | 8 | 63       | 63.8     | 11.3        | 18.9        | -0.117      |
| 3934       | 8 | 56       | 57.7     | 25.5        | 18.6        | -0.263      |
| 1.477e+004 | 8 | 41       | 37.4     | 17          | 17.4        | 0.589       |
| 2.684e+004 | 8 | 32       | 28.3     | 17          | 16.7        | 0.636       |
| 4.99e+004  | 8 | 17       | 20.8     | 17          | 15.9        | -0.678      |

62 Model Descriptions for likelihoods calculated

```

63
64
65 Model A1:      Yij = Mu(i) + e(ij)
66              Var{e(ij)} = Sigma^2
67
68 Model A2:      Yij = Mu(i) + e(ij)
69              Var{e(ij)} = Sigma(i)^2
70

```

1 Model A3:  $Y_{ij} = \mu(i) + e_{ij}$   
 2  $\text{Var}\{e_{ij}\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$   
 3 Model A3 uses any fixed variance parameters that  
 4 were specified by the user

5  
 6 Model R:  $Y_i = \mu + e(i)$   
 7  $\text{Var}\{e(i)\} = \sigma^2$   
 8  
 9

10 Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -181.340979     | 8         | 378.681959 |
| A2     | -175.820265     | 14        | 379.640529 |
| A3     | -181.238690     | 9         | 380.477380 |
| fitted | -189.800260     | 5         | 389.600520 |
| R      | -212.367055     | 2         | 428.734109 |

19 Explanation of Tests

21  
 22 Test 1: Do responses and/or variances differ among Dose levels?  
 23 (A2 vs. R)  
 24 Test 2: Are Variances Homogeneous? (A1 vs A2)  
 25 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 26 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
 27 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)  
 28

29 Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 73.0936                  | 12      | <.0001   |
| Test 2 | 11.0414                  | 6       | 0.0871   |
| Test 3 | 10.8369                  | 5       | 0.05471  |
| Test 4 | 17.1231                  | 4       | 0.001829 |

38 The p-value for Test 1 is less than .05. There appears to be a  
 39 difference between response and/or variances among the dose levels  
 40 It seems appropriate to model the data

42 The p-value for Test 2 is less than .1. A non-homogeneous variance  
 43 model appears to be appropriate

45 The p-value for Test 3 is less than .1. You may want to consider a  
 46 different variance model

48 The p-value for Test 4 is less than .1. You may want to try a different  
 49 model

52 Benchmark Dose Computation

53  
 54 Specified effect = 1  
 55  
 56 Risk Type = Estimated standard deviations from the control mean  
 57  
 58 Confidence level = 0.95  
 59  
 60 BMD = 4756.06  
 61  
 62 BMDL = 825.553  
 63

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -181.340979     | 8         | 378.681959 |
| A2     | -175.820265     | 14        | 379.640529 |
| A3     | -181.238690     | 9         | 380.477380 |
| fitted | -184.762700     | 6         | 381.525401 |
| R      | -212.367055     | 2         | 428.734109 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 73.0936                  | 12      | <.0001  |
| Test 2 | 11.0414                  | 6       | 0.0871  |
| Test 3 | 10.8369                  | 5       | 0.05471 |
| Test 4 | 7.04802                  | 3       | 0.07038 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value   |
|--------|--------------------------|---------|-----------|
| Test 1 | 25.7626                  | 4       | <.0001    |
| Test 2 | 15.1732                  | 2       | 0.0005072 |
| Test 3 | 0.347663                 | 1       | 0.5554    |
| Test 4 | 0.843918                 | 1       | 0.3583    |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -83.696404      | 4         | 175.392808 |
| A2     | -73.511830      | 6         | 159.023660 |
| A3     | -73.530233      | 5         | 157.060467 |
| fitted | -75.868688      | 4         | 159.737377 |
| R      | -90.294746      | 2         | 184.589492 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 33.5658                  | 4       | <.0001  |
| Test 2 | 20.3691                  | 2       | <.0001  |
| Test 3 | 0.0368066                | 1       | 0.8479  |
| Test 4 | 4.67691                  | 1       | 0.03057 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Rel Male Thymus wt Tbl 2

The form of the response function is:

$$Y[\text{dose}] = \text{beta}_0 + \text{beta}_1 \cdot \text{dose} + \text{beta}_2 \cdot \text{dose}^2 + \dots$$

Dependent variable = Mean  
 Independent variable = Dose  
 Signs of the polynomial coefficients are not restricted  
 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) \cdot \text{rho}$   
 Total number of dose groups = 3  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

```

lalpha = 6.34368
rho = 0
beta_0 = 74.2008
beta_1 = -0.219781

```

Asymptotic Correlation Matrix of Parameter Estimates

16 ~~~~~

18 The form of the response function is:

19  $Y[\text{dose}] = \text{beta}_0 + \text{beta}_1 \cdot \text{dose} + \text{beta}_2 \cdot \text{dose}^2 + \dots$

20  
21  
22  
23 Dependent variable = Mean  
24 Independent variable = Dose  
25 Signs of the polynomial coefficients are not restricted  
26 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

27  
28 Total number of dose groups = 3  
29 Total number of records with missing values = 0  
30 Maximum number of iterations = 250  
31 Relative Function Convergence has been set to: 1e-008  
32 Parameter Convergence has been set to: 1e-008

33  
34  
35  
36

Default Initial Parameter Values

1                    lalpha =        6.63936  
 2                    rho =            0  
 3                    beta\_0 =        64.1858  
 4                    beta\_1 =       -0.332668

7                    Asymptotic Correlation Matrix of Parameter Estimates

|        | lalpha | rho   | beta_0 | beta_1 |
|--------|--------|-------|--------|--------|
| lalpha | 1      | -1    | 0.11   | -0.18  |
| rho    | -1     | 1     | -0.11  | 0.18   |
| beta_0 | 0.11   | -0.11 | 1      | -0.75  |
| beta_1 | -0.18  | 0.18  | -0.75  | 1      |

21                    Parameter Estimates

| Variable | Estimate  | Std. Err. | 95.0% Wald Confidence Interval |                   |

32                    Table of Data and Estimated Values of Interest

| Dose | N  | Obs Mean | Est Mean | Obs Std Dev | Est Std Dev | Scaled Res. |
|------|----|----------|----------|-------------|-------------|-------------|
| 0    | 10 | 72.7     | 63.7     | 24.6        | 29.6        | 0.962       |
| 25   | 10 | 44.5     | 55.7     | 32.9        | 28.5        | -1.24       |
| 100  | 10 | 33.8     | 31.6     | 24.6        | 24.3        | 0.277       |

43                    Model Descriptions for likelihoods calculated

46 Model A1:             $Y_{ij} = \mu(i) + e(ij)$   
 47                     $\text{Var}\{e(ij)\} = \sigma^2$   
 48  
 49 Model A2:             $Y_{ij} = \mu(i) + e(ij)$   
 50                     $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 51  
 52 Model A3:             $Y_{ij} = \mu(i) + e(ij)$   
 53                     $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
 54                    Model A3 uses any fixed variance parameters that  
 55                    were specified by the user  
 56  
 57 Model R:               $Y_i = \mu + e(i)$   
 58                     $\text{Var}\{e(i)\} = \sigma^2$

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 11.0943                  | 4       | 0.02552 |
| Test 2 | 1.16207                  | 2       | 0.5593  |
| Test 3 | 1.11128                  | 1       | 0.2918  |
| Test 4 | 2.59862                  | 1       | 0.107   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. Consider running a homogeneous model

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 92.2435

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\lambda + \rho \cdot \ln(\mu(i)))$   
 Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -51.421748      | 5         | 112.843496 |
| A2     | -15.312111      | 8         | 46.624223  |
| A3     | -15.669627      | 6         | 43.339255  |
| fitted | -27.243469      | 4         | 62.486938  |
| R      | -68.750584      | 2         | 141.501167 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
 (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 106.877                  | 6       | <.0001  |
| Test 2 | 72.2193                  | 3       | <.0001  |
| Test 3 | 0.715032                 | 2       | 0.6994  |
| Test 4 | 23.1477                  | 2       | <.0001  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

19  
 20 The form of the response function by Model:  
 21 Model 2: Y[dose] = a \* exp{sign \* b \* dose}  
 22 Model 3: Y[dose] = a \* exp{sign \* (b \* dose)^d}  
 23 Model 4: Y[dose] = a \* [c-(c-1) \* exp{-b \* dose}]  
 24 Model 5: Y[dose] = a \* [c-(c-1) \* exp{-(b \* dose)^d}]  
 25  
 26 Note: Y[dose] is the median response for exposure = dose;  
 27 sign = +1 for increasing trend in data;  
 28 sign = -1 for decreasing trend.  
 29  
 30 Model 2 is nested within Models 3 and 4.  
 31 Model 3 is nested within Model 5.  
 32 Model 4 is nested within Model 5.

33  
 34  
 35 Dependent variable = Mean

1 Independent variable = Dose  
 2 Data are assumed to be distributed: normally  
 3 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 4  $\rho$  is set to 0.  
 5 A constant variance model is fit.  
 6  
 7 Total number of dose groups = 10  
 8 Total number of records with missing values = 0  
 9 Maximum number of iterations = 250

6 Other models for which likelihoods are calculated:  
 7

8       Model A1:            $Y_{ij} = \mu(i) + e(ij)$   
                            $\text{Var}\{e(ij)\} = \sigma^2$   
 9  
 10  
 11       Model A2:            $Y_{ij} = \mu(i) + e(ij)$   
                            $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 12  
 13  
 14       Model A3:            $Y_{ij} = \mu(i) + e(ij)$   
                            $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$   
 15  
 16  
 17       Model R:             $Y_{ij} = \mu + e(i)$   
                            $\text{Var}\{e(ij)\} = \sigma^2$   
 18  
 19

20  
 21                                   Likelihoods of Interest  
 22

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -233.0774       | 11 | 488.1549 |
| A2    | -230.2028       | 20 | 500.4056 |
| A3    | -233.0774       | 11 | 488.1549 |
| R     | -268.4038       | 2  | 540.8076 |
| 4     | -234.1019       | 4  | 476.2038 |

31  
 32 Additive constant for all log-likelihoods =       -66.16. This constant added to the  
 33 above values gives the log-likelihood including the term that does not  
 34 depend on the model parameters.  
 35

36  
 37                                   Explanation of Tests  
 38

39 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 40 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 41 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 42  
 43 Test 6a: Does Model 4 fit the data? (A3 vs 4)  
 44  
 45

46                                   Tests of Interest  
 47

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 76.4                     | 18    | < 0.0001 |
| Test 2  | 5.749                    | 9     | 0.7647   |
| Test 3  | 5.749                    | 9     | 0.7647   |
| Test 6a | 2.049                    | 7     | 0.9571   |

56 The p-value for Test 1 is less than .05. There appears to be a  
 57 difference between response and/or variances among the dose  
 58 levels, it seems appropriate to model the data.  
 59

60 The p-value for Test 2 is greater than .1. A homogeneous  
 61 variance model appears to be appropriate here.  
 62

63 The p-value for Test 3 is greater than .1. The modeled  
 64 variance appears to be appropriate here.  
 65

66 The p-value for Test 6a is greater than .1. Model 4 seems  
 67 to adequately describe the data.  
 68  
 69

70 Benchmark Dose Computations:

Specified Effect = 1.000000  
 Risk Type = Estimated standard deviations from control  
 Confidence Level = 0.950000  
 BMD = 56.3321  
 BMDL = 30.0635

<sup>a</sup> Values  $< 0.1$  means nonconstant variance model should be selected; Values  $\geq 0.1$  means a constant variance model should be selected

<sup>b</sup> Values  $< 0.1$  fail to meet BMDS goodness-of-fit criteria

<sup>c</sup> Best-fitting model as assessed by lowest-AIC criterion, bolded, presented in this appendix

19  
20 The form of the response function is:

21  
22  $Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$

23  
24  
25 Dependent variable = Mean  
26 Independent variable = Dose  
27 rho is set to 0  
28 Power parameter restricted to be greater than 1  
29 A constant variance model is fit

30  
31 Total number of dose groups = 4  
32 Total number of records with missing values = 0  
33 Maximum number of iterations = 250  
34 Relative Function Convergence has been set to: 1e-008  
35 Parameter Convergence has been set to: 1e-008

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -rho -n  
 have been estimated at a boundary point, or have been specified by the user,  
 and do not appear in the correlation matrix )

|           | alpha     | intercept | v        | k       |
|-----------|-----------|-----------|----------|---------|
| alpha     | 1         | -1.7e-009 | 4.6e-009 | -2e-009 |
| intercept | -1.7e-009 | 1         | -0.49    | -0.54   |
| v         | 4.6e-009  | -0.49     | 1        | -0.27   |
| k         | -2e-009   | -0.54     | -0.27    | 1       |

Parameter Estimates

| Variable  | Estimate | Std. Err. | 95.0% Wald Confidence Interval |                   |
|-----------|----------|-----------|--------------------------------|-------------------|
|           |          |           | Lower Conf. Limit              | Upper Conf. Limit |
| alpha     | 0.183391 | 0.0405044 | 0.104004                       | 0.262778          |
| intercept | 5.47882  | 0.130251  | 5.22353                        | 5.7341            |
| v         | -1.25656 | 0.197258  | -1.64318                       | -0.869946         |
| n         | 1        | NA        |                                |                   |
| k         | 0.361009 | 0.220645  | -0.0714485                     | 0.793466          |

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

| Dose | N  | Obs Mean | Est Mean | Obs Std Dev | Est Std Dev | Scaled Res. |
|------|----|----------|----------|-------------|-------------|-------------|
| 0    | 10 | 5.49     | 5.48     | 0.538       | 0.428       | 0.0826      |
| 0.12 | 10 | 5.14     | 5.17     | 0.379       | 0.428       | -0.187      |
| 0.61 | 11 | 4.71     | 4.69     | 0.398       | 0.428       | 0.159       |
| 4.9  | 10 | 4.3      | 4.31     | 0.474       | 0.428       | -0.0626     |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | 14.306322       | 5         | -18.612644 |
| A2     | 15.093716       | 8         | -14.187432 |
| A3     | 14.306322       | 5         | -18.612644 |
| fitted | 14.270730       | 4         | -20.541459 |
| R      | -0.636909       | 2         | 5.273819   |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 31.4613                  | 6       | <.0001  |
| Test 2 | 1.57479                  | 3       | 0.6651  |
| Test 3 | 1.57479                  | 3       | 0.6651  |
| Test 4 | 0.0711848                | 1       | 0.7896  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 0.186641  
BMDL = 0.0714793

18  
 19 The form of the response function is:

20  
 21  $Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$

22  
 23  
 24  
 25 Dependent variable = Mean  
 26 Independent variable = Dose  
 27 The power is restricted to be greater than or equal to 1  
 28 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

29  
 30 Total number of dose groups = 4  
 31 Total number of records with missing values = 0  
 32 Maximum number of iterations = 250  
 33 Relative Function Convergence has been set to: 1e-008  
 34 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = -2.54423  
rho = 0  
control = 0.562  
slope = -0.216619  
power = -0.019526

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -power have been estimated at a boundary point, or have been specified by the user, and do not appear in the correlation matrix )

|         | lalpha | rho   | control | slope |
|---------|--------|-------|---------|-------|
| lalpha  | 1      | 0.99  | 0.39    | -0.97 |
| rho     | 0.99   | 1     | 0.33    | -0.98 |
| control | 0.39   | 0.33  | 1       | -0.4  |
| slope   | -0.97  | -0.98 | -0.4    | 1     |

Parameter Estimates

| Variable | Estimate   | Std. Err. | 95.0% Wald Confidence Interval |                   |
|----------|------------|-----------|--------------------------------|-------------------|
|          |            |           | Lower Conf. Limit              | Upper Conf. Limit |
| lalpha   | -7.29904   | 2.85129   | -12.8875                       | -1.71062          |
| rho      | -4.37824   | 3.97762   | -12.1742                       | 3.41775           |
| control  | 0.500643   | 0.0242054 | 0.453202                       | 0.548085          |
| slope    | -0.0492183 | 0.0335618 | -0.114998                      | 0.0165617         |
| power    | 1          | NA        |                                |                   |

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

| Dose | N  | Obs Mean | Est Mean | Obs Std Dev | Est Std Dev | Scaled Res. |
|------|----|----------|----------|-------------|-------------|-------------|
| 0    | 10 | 0.562    | 0.501    | 0.158       | 0.118       | 1.64        |
| 0.12 | 10 | 0.448    | 0.495    | 0.0696      | 0.121       | -1.22       |
| 0.61 | 11 | 0.445    | 0.471    | 0.113       | 0.135       | -0.628      |
| 4.9  | 10 | 0.352    | 0.259    | 0.528       | 0.498       | 0.587       |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \exp(l\alpha + \rho \cdot \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user

1 Model R:  $Y_i = \mu + e(i)$   
2  $\text{Var}\{e(i)\} = \sigma^2$   
3  
4

5 Likelihoods of Interest  
6

| 7 Model   | 8 Log(likelihood) | 9 # Param's | 10 AIC     |
|-----------|-------------------|-------------|------------|
| 11 A1     | 33.761192         | 5           | -57.522384 |
| 12 A2     | 57.094821         | 8           | -98.189643 |
| 13 A3     | 51.239109         | 6           | -90.478218 |
| 14 fitted | 50.896393         | 4           | -93.792785 |
| 15 R      | 32.253943         | 2           | -60.507885 |

16 Explanation of Tests  
17

- 18 Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)
- 19 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 20 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 21 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 22 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

23 Tests of Interest  
24

| 25 Test   | 26 $-2 \times \log(\text{Likelihood Ratio})$ | 27 Test df | 28 p-value |
|-----------|----------------------------------------------|------------|------------|
| 29 Test 1 | 49.6818                                      | 6          | <.0001     |
| 30 Test 2 | 46.6673                                      | 3          | <.0001     |
| 31 Test 3 | 11.7114                                      | 2          | 0.002863   |
| 32 Test 4 | 0.685433                                     | 2          | 0.7098     |

33 The p-value for Test 1 is less than .05. There appears to be a  
34 difference between response and/or variances among the dose levels  
35 It seems appropriate to model the data  
36

37 The p-value for Test 2 is less than .1. A non-homogeneous variance  
38 model appears to be appropriate  
39

40 The p-value for Test 3 is less than .1. You may want to consider a  
41 different variance model  
42

43 The p-value for Test 4 is greater than .1. The model chosen seems  
44 to adequately describe the data  
45

<sup>a</sup> Values  $< 0.1$  means nonconstant variance model should be selected; Values  $\geq 0.1$  means a constant variance model should be selected

<sup>b</sup> Values  $< 0.1$  fail to meet BMDS goodness-of-fit criteria

<sup>c</sup> **Best-fitting model as assessed by lowest-AIC criterion, bolded, presented in this appendix**

 18

19  
 20 The form of the response function by Model:  
 21 Model 2: Y[dose] = a \* exp{sign \* b \* dose}  
 22 Model 3: Y[dose] = a \* exp{sign \* (b \* dose)^d}  
 23 Model 4: Y[dose] = a \* [c-(c-1) \* exp{-b \* dose}]  
 24 Model 5: Y[dose] = a \* [c-(c-1) \* exp{-(b \* dose)^d}]  
 25

26 Note: Y[dose] is the median response for exposure = dose;  
 27 sign = +1 for increasing trend in data;  
 28 sign = -1 for decreasing trend.  
 29

30 Model 2 is nested within Models 3 and 4.  
 31 Model 3 is nested within Model 5.  
 32 Model 4 is nested within Model 5.  
 33  
 34

35 Dependent variable = Mean

1 Independent variable = Dose  
 2 Data are assumed to be distributed: normally  
 3 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 4  $\rho$  is set to 0.  
 5 A constant variance model is fit.  
 6  
 7 Total number of dose groups = 5  
 8 Total number of records with missing values = 0  
 9 Maximum number of iterations = 250  
 10 Relative Function Convergence has been set to: 1e-008  
 11 Parameter Convergence has been set to: 1e-008

 61  
 62  
 63  
 64  
 65  
 66 Other models for which likelihoods are calculated:

67  
 68 Model A1:  $Y_{ij} = \mu(i) + e_{(ij)}$   
 69  $\text{Var}\{e_{(ij)}\} = \sigma^2$   
 70

1 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 2  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 3  
 4 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 5  $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$   
 6  
 7 Model R:  $Y_{ij} = \mu + e(i)$   
 8  $\text{Var}\{e(ij)\} = \sigma^2$   
 9

10  
 11 Likelihoods of Interest

| 12 Model | 13 Log(likelihood) | 14 DF | 15 AIC   |
|----------|--------------------|-------|----------|
| 16 A1    | -186.2212          | 6     | 384.4424 |
| 17 A2    | -182.3775          | 10    | 384.755  |
| 18 A3    | -186.2212          | 6     | 384.4424 |
| 19 R     | -204.9225          | 2     | 413.8449 |
| 20 2     | -186.7751          | 3     | 379.5501 |

21 Additive constant for all log-likelihoods = -37.68. This constant added to the  
 22 above values gives the log-likelihood including the term that does not  
 23 depend on the model parameters.  
 24

25  
 26  
 27 Explanation of Tests

28  
 29 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 30 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 31 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 32 Test 4: Does Model 2 fit the data? (A3 vs. 2)  
 33  
 34

35 Tests of Interest

| 36 Test   | 37 -2*log(Likelihood Ratio) | 38 D. F. | 39 p-value |
|-----------|-----------------------------|----------|------------|
| 40 Test 1 | 45.09                       | 8        | < 0.0001   |
| 41 Test 2 | 7.687                       | 4        | 0.1037     |
| 42 Test 3 | 7.687                       | 4        | 0.1037     |
| 43 Test 4 | 1.108                       | 3        | 0.7752     |

44  
 45 The p-value for Test 1 is less than .05. There appears to be a  
 46 difference between response and/or variances among the dose  
 47 levels, it seems appropriate to model the data.  
 48

49 The p-value for Test 2 is greater than .1. A homogeneous  
 50 variance model appears to be appropriate here.  
 51

52 The p-value for Test 3 is greater than .1. The modeled  
 53 variance appears to be appropriate here.  
 54

55 The p-value for Test 4 is greater than .1. Model 2 seems  
 56 to adequately describe the data.  
 57  
 58

59 Benchmark Dose Computations:

60 Specified Effect = 1.000000

61 Risk Type = Estimated standard deviations from control

62 Confidence Level = 0.950000

63 BMD = 6.12391

64 BMDL = 4.52632

<sup>a</sup> Values  $< 0.1$  means nonconstant variance model should be selected; Values  $\geq 0.1$  means a constant variance model should be selected

<sup>b</sup> Values  $< 0.1$  fail to meet BMDS goodness-of-fit criteria

<sup>c</sup> **Best-fitting model as assessed by lowest-AIC criterion, bolded, presented in this appendix**

Male BW Tbl 1

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean

Independent variable = Dose

rho is set to 0

Power parameter restricted to be greater than 1

A constant variance model is fit

Total number of dose groups = 5

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -rho -n  
 have been estimated at a boundary point, or have been specified by the user,  
 and do not appear in the correlation matrix )

|           | alpha     | intercept | v        | k         |
|-----------|-----------|-----------|----------|-----------|
| alpha     | 1         | 1.1e-008  | 5.5e-008 | -5.8e-008 |
| intercept | 1.1e-008  | 1         | 0.27     | -0.46     |
| v         | 5.5e-008  | 0.27      | 1        | -0.94     |
| k         | -5.8e-008 | -0.46     | -0.94    | 1         |

Parameter Estimates

| Variable  | Estimate | Std. Err. | 95.0% Wald Confidence Interval |                   |
|-----------|----------|-----------|--------------------------------|-------------------|
|           |          |           | Lower Conf. Limit              | Upper Conf. Limit |
| alpha     | 3309.29  | 697.66    | 1941.9                         | 4676.68           |
| intercept | 688.613  | 11.4849   | 666.103                        | 711.123           |
| v         | -430.869 | 146.654   | -718.305                       | -143.432          |
| n         | 1        | NA        |                                |                   |
| k         | 18.1326  | 12.6279   | -6.61762                       | 42.8828           |

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

| Dose | N  | Obs Mean | Est Mean | Obs Std Dev | Est Std Dev | Scaled Res. |
|------|----|----------|----------|-------------|-------------|-------------|
| 0    | 10 | 713      | 689      | 47.4        | 57.5        | 1.34        |
| 0.12 | 10 | 682      | 686      | 50.6        | 57.5        | -0.208      |
| 0.61 | 11 | 651      | 675      | 63          | 57.5        | -1.36       |

| 26   | 4  | 433      | 435      | 76          | 57.5        | -0.0617     |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -202.863522     | 6         | 417.727044 |
| A2     | -202.022697     | 10        | 424.045393 |
| A3     | -202.863522     | 6         | 417.727044 |
| fitted | -204.851020     | 4         | 417.702041 |
| R      | -226.717147     | 2         | 457.434293 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 49.3889                  | 8       | <.0001  |
| Test 2 | 1.68165                  | 4       | 0.794   |
| Test 3 | 1.68165                  | 4       | 0.794   |
| Test 4 | 3.975                    | 2       | 0.137   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 2.79396  
BMDL = 1.55261

| 0    | 8  | 4.3      | 0.7354      |
| 0.12 | 10 | 4.49     | 1.107       |
| 0.68 | 9  | 4.27     | 0.48        |
| 4.86 | 10 | 5.54     | 1.36        |

49 Estimated Values of Interest

| Dose | Est Mean | Est Std | Scaled Residual |
|------|----------|---------|-----------------|
| 0    | 4.312    | 0.7964  | -0.04371        |
| 0.12 | 4.338    | 0.8054  | 0.5953          |
| 0.68 | 4.462    | 0.8483  | -0.6795         |
| 4.86 | 5.505    | 1.25    | 0.08976         |

60 Other models for which likelihoods are calculated:

61 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 62  $\text{Var}\{e(ij)\} = \sigma^2$

63 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 64  $\text{Var}\{e(ij)\} = \sigma(i)^2$

65 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 66  $\text{Var}\{e(ij)\} = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

67 *This document is a draft for review purposes only and does not constitute Agency policy.*

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -16.54794       | 5  | 43.09588 |
| A2    | -11.40563       | 8  | 38.81126 |
| A3    | -12.66678       | 6  | 37.33356 |
| R     | -21.58737       | 2  | 47.17474 |
| 2     | -15.2671        | 4  | 38.53419 |

Additive constant for all log-likelihoods = -34. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value  |
|--------|--------------------------|-------|----------|
| Test 1 | 20.36                    | 6     | 0.002385 |
| Test 2 | 10.28                    | 3     | 0.0163   |
| Test 3 | 2.522                    | 2     | 0.2833   |
| Test 4 | 5.201                    | 2     | 0.07425  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. Model 2 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 3.37444

BMDL = 2.10781

18

19

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

26

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

29

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

60 Other models for which likelihoods are calculated:

61 Model A1:  $Y_{ij} = \mu(i) + e_{(ij)}$   
 62  $\text{Var}\{e_{(ij)}\} = \sigma^2$

63 Model A2:  $Y_{ij} = \mu(i) + e_{(ij)}$   
 64  $\text{Var}\{e_{(ij)}\} = \sigma(i)^2$

65 Model A3:  $Y_{ij} = \mu(i) + e_{(ij)}$   
 66  $\text{Var}\{e_{(ij)}\} = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

67 *This document is a draft for review purposes only and does not constitute Agency policy.*

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -26.53142       | 5  | 63.06284 |
| A2    | -13.9487        | 8  | 43.89739 |
| A3    | -15.65277       | 6  | 43.30554 |
| R     | -31.57211       | 2  | 67.14421 |
| 4     | -24.06213       | 5  | 58.12426 |

Additive constant for all log-likelihoods = -37.68. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 35.25                    | 6     | < 0.0001 |
| Test 2  | 25.17                    | 3     | < 0.0001 |
| Test 3  | 3.408                    | 2     | 0.1819   |
| Test 6a | 16.82                    | 1     | < 0.0001 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is less than .1. Model 4 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 0.376095

BMDL = 0.137425

<sup>a</sup> Values  $< 0.1$  means nonconstant variance model should be selected; Values  $\geq 0.1$  means a constant variance model should be selected

<sup>b</sup> Values  $< 0.1$  fail to meet BMDS goodness-of-fit criteria

<sup>c</sup> **Best-fitting model as assessed by lowest-AIC criterion, bolded, presented in this appendix**

Rel Male Thymus wt, Tbl 2

18

19

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

26

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

30

Model 2 is nested within Models 3 and 4.

31

Model 3 is nested within Model 5.

32

Model 4 is nested within Model 5.

Dependent variable = Mean

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 Independent variable = Dose  
 2 Data are assumed to be distributed: normally  
 3 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 4  $\rho$  is set to 0.  
 5 A constant variance model is fit.  
 6  
 7 Total number of dose groups = 4  
 8 Total number of records with missing values = 0  
 9 Maximum number of iterations = 250  
 10 Relative Function Convergence has been set to: 1e-008  
 11 Parameter Convergence has been set to: 1e-008

12 MLE solution provided: Exact

Table 5

~~~~~

The form of the response function is:

$$Y[\text{dose}] = \text{beta}_0 + \text{beta}_1 \cdot \text{dose} + \text{beta}_2 \cdot \text{dose}^2 + \dots$$

Dependent variable = Mean

Independent variable = Dose

rho is set to 0

Signs of the polynomial coefficients are not restricted

A constant variance model is fit

Total number of dose groups = 4

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	3.115550	5	3.768900
A2	4.489557	8	7.020886
A3	3.115550	5	3.768900

This document is a draft for review purposes only and does not constitute Agency policy.

1 fitted -1.775882 3 9.551763
 2 R -2.435087 2 8.870174
 3
 4

5 Explanation of Tests
 6

7 Test 1: Do responses and/or variances differ among Dose levels?
 8 (A2 vs. R)
 9 Test 2: Are Variances Homogeneous? (A1 vs A2)
 10 Test 3: Are variances adequately modeled? (A2 vs. A3)
 11 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
 12 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
 13

14 Tests of Interest
 15

16 Test	-2*log(Likelihood Ratio)	17 Test df	18 p-value
18 Test 1	13.8493	6	0.03137
19 Test 2	2.74801	3	0.4321
20 Test 3	2.74801	3	0.4321
21 Test 4	9.78286	2	0.007511

22
 23 The p-value for Test 1 is less than .05. There appears to be a
 24 difference between response and/or variances among the dose levels
 25 It seems appropriate to model the data
 26

27 The p-value for Test 2 is greater than .1. A homogeneous variance
 28 model appears to be appropriate here
 29

30
 31 The p-value for Test 3 is greater than .1. The modeled variance appears
 32 to be appropriate here
 33

34 The p-value for Test 4 is less than .1. You may want to try a different
 35 model
 36

60 Model Descriptions for likelihoods calculated

```

61
62
63 Model A1:      Yij = Mu(i) + e(ij)
64              Var{e(ij)} = Sigma^2
65
66 Model A2:      Yij = Mu(i) + e(ij)
67              Var{e(ij)} = Sigma(i)^2
68
69 Model A3:      Yij = Mu(i) + e(ij)
70              Var{e(ij)} = exp(lalpha + rho*ln(Mu(i)))

```

1 Model A3 uses any fixed variance parameters that
2 were specified by the user

3
4 Model R: $Y_i = \mu + e(i)$
5 $\text{Var}\{e(i)\} = \sigma^2$

6
7
8 Likelihoods of Interest

9

Model	Log(likelihood)	# Param's	AIC
A1	56.758717	6	-101.517434
A2	85.856450	10	-151.712901
A3	84.934314	7	-155.868628
fitted	80.575940	5	-151.151880
R	45.373551	2	-86.747101

16

17
18 Explanation of Tests

19
20 Test 1: Do responses and/or variances differ among Dose levels?
21 (A2 vs. R)
22 Test 2: Are Variances Homogeneous? (A1 vs A2)
23 Test 3: Are variances adequately modeled? (A2 vs. A3)
24 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
25 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

26
27 Tests of Interest

28

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	80.9658	8	<.0001
Test 2	58.1955	4	<.0001
Test 3	1.84427	3	0.6053
Test 4	8.71675	2	0.0128

35

36 The p-value for Test 1 is less than .05. There appears to be a
37 difference between response and/or variances among the dose levels
38 It seems appropriate to model the data

39
40 The p-value for Test 2 is less than .1. A non-homogeneous variance
41 model appears to be appropriate

42
43 The p-value for Test 3 is greater than .1. The modeled variance appears
44 to be appropriate here

45
46 The p-value for Test 4 is less than .1. You may want to try a different
47 model

48
49

d	1

27 Parameter Estimates

Variable	Model 4
lnalpha	-5.49254
rho	2.91176
a	9.2
b	0.295128
c	1.83696
d	18

39 Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	5	9.8	1.3
1	5	8.6	2
10	5	16.4	4.7
100	5	17.4	4

49 Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	8.93	1.733	1.122
1	10.04	2.038	-1.582
10	15.42	3.683	0.5967
100	17.64	4.436	-0.1211

60 Other models for which likelihoods are calculated:

- 61 Model A1: $Y_{ij} = \mu(i) + e_{(ij)}$
 $\text{Var}\{e_{(ij)}\} = \sigma^2$
 62
 63 Model A2: $Y_{ij} = \mu(i) + e_{(ij)}$
 $\text{Var}\{e_{(ij)}\} = \sigma(i)^2$
 64
 65 Model A3: $Y_{ij} = \mu(i) + e_{(ij)}$
 $\text{Var}\{e_{(ij)}\} = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

66 *This document is a draft for review purposes only and does not constitute Agency policy.*

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-31.69739	5	73.39478
A2	-27.21541	8	70.43081
A3	-28.16434	6	68.32868
R	-41.73188	2	87.46376
4	-30.27804	5	70.55608

Additive constant for all log-likelihoods = -18.38. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	29.03	6	< 0.0001
Test 2	8.964	3	0.02977
Test 3	1.898	2	0.3872
Test 6a	4.227	1	0.03978

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is less than .1. Model 4 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 1.62505

BMDL = 0.729987

This document is a draft for review purposes only and does not constitute Agency policy.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	50.195349	5	-90.390697
A2	51.400051	8	-86.800103

This document is a draft for review purposes only and does not constitute Agency policy.

1	A3	50.195349	5	-90.390697
2	fitted	49.867385	3	-93.734769
3	R	41.049755	2	-78.099510

6 Explanation of Tests

7
8 Test 1: Do responses and/or variances differ among Dose levels?
9 (A2 vs. R)
10 Test 2: Are Variances Homogeneous? (A1 vs A2)
11 Test 3: Are variances adequately modeled? (A2 vs. A3)
12 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
13 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
14

15 Tests of Interest

17 Test	-2*log(Likelihood Ratio)	Test df	p-value
19 Test 1	20.7006	6	0.002076
20 Test 2	2.40941	3	0.4919
21 Test 3	2.40941	3	0.4919
22 Test 4	0.655928	2	0.7204

24 The p-value for Test 1 is less than .05. There appears to be a
25 difference between response and/or variances among the dose levels
26 It seems appropriate to model the data
27

28 The p-value for Test 2 is greater than .1. A homogeneous variance
29 model appears to be appropriate here
30

31 The p-value for Test 3 is greater than .1. The modeled variance appears
32 to be appropriate here
33

34 The p-value for Test 4 is greater than .1. The model chosen seems
35 to adequately describe the data
36

(x10^6) Table 1 without Vitamin E

16
17
18

The form of the response function is:

19
20
21

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

22
23

Dependent variable = Mean

Independent variable = Dose

rho is set to 0

Power parameter restricted to be greater than 1

A constant variance model is fit

24
25
26

Total number of dose groups = 4

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values
 alpha = 7.23328
 rho = 0 Specified
 intercept = 22.19
 v = -9.09
 n = 1.80484
 k = 0.697086

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -rho -n
 have been estimated at a boundary point, or have been specified by the user,
 and do not appear in the correlation matrix)

	alpha	intercept	v	k
alpha	1	6.3e-010	3e-008	8.3e-009
intercept	6.3e-010	1	-0.78	-0.23
v	3e-008	-0.78	1	-0.17
k	8.3e-009	-0.23	-0.17	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
alpha	6.03567	1.74235	2.62073	9.45061
intercept	22.1885	1.00316	20.2223	24.1547
v	-9.00869	1.26801	-11.4939	-6.52343
n	1	NA		
k	0.386669	0.265663	-0.134021	0.907359

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

Dose	N	Obs Mean	Est Mean	Obs Std Dev	Est Std Dev	Scaled Res.
0	6	22.2	22.2	2.67	2.46	0.00151
1	6	15.7	15.7	2.65	2.46	-0.0218
10	6	13.7	13.5	2.19	2.46	0.134
100	6	13.1	13.2	3.16	2.46	-0.114

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $Var\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $Var\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $Var\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

1 Model R: $Y_i = \mu + e(i)$
2 $\text{Var}\{e(i)\} = \sigma^2$
3
4

5 Likelihoods of Interest
6

7 Model	8 Log(likelihood)	9 # Param's	10 AIC
11 A1	-33.556444	5	77.112888
12 A2	-33.158811	8	82.317623
13 A3	-33.556444	5	77.112888
14 fitted	-33.572245	4	75.144490
15 R	-47.392394	2	98.784788

16 Explanation of Tests
17

- 18 Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
- 19 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 20 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 21 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 22 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

23 Tests of Interest
24

25 Test	26 $-2 \cdot \log(\text{Likelihood Ratio})$	27 Test df	28 p-value
29 Test 1	28.4672	6	<.0001
30 Test 2	0.795266	3	0.8506
31 Test 3	0.795266	3	0.8506
32 Test 4	0.031602	1	0.8589

33 The p-value for Test 1 is less than .05. There appears to be a
34 difference between response and/or variances among the dose levels
35 It seems appropriate to model the data
36

37 The p-value for Test 2 is greater than .1. A homogeneous variance
38 model appears to be appropriate here
39

40 The p-value for Test 3 is greater than .1. The modeled variance appears
41 to be appropriate here
42

43 The p-value for Test 4 is greater than .1. The model chosen seems
44 to adequately describe the data
45
46

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-130.4861	5	270.9723
A2	-129.2199	8	274.4398
A3	-130.4861	5	270.9723
R	-132.6269	2	269.2537
2	-132.404	3	270.8079

Additive constant for all log-likelihoods = -36.76. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
Test 2: Are Variances Homogeneous? (A2 vs. A1)
Test 3: Are variances adequately modeled? (A2 vs. A3)
Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	6.814	6	0.3384
Test 2	2.533	3	0.4694
Test 3	2.533	3	0.4694
Test 4	3.836	2	0.1469

The p-value for Test 1 is greater than .05. There may not be a difference between responses and/or variances among the dose levels. Modelling the data with a dose/response curve may not be appropriate.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. Model 2 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 317.497

BMDL = 111.954

This document is a draft for review purposes only and does not constitute Agency policy.

 62 $\text{Var}\{e(ij)\} = \sigma^2$

63 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 64 $\text{Var}\{e(ij)\} = \sigma(i)^2$

65 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 66 $\text{Var}\{e(ij)\} = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

67 *This document is a draft for review purposes only and does not constitute Agency policy.*

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-159.7613	5	329.5225
A2	-151.9206	8	319.8412
A3	-152.6038	6	317.2077
R	-165.9023	2	335.8046
4	-153.0132	5	316.0265

Additive constant for all log-likelihoods = -36.76. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	27.96	6	< 0.0001
Test 2	15.68	3	0.001318
Test 3	1.366	2	0.505
Test 6a	0.8188	1	0.3655

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is greater than .1. Model 4 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 0.161712

BMDL = 0.100383

Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e_{ij}\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-104.1655	5	218.331
A2	-101.1402	8	218.2803
A3	-104.1655	5	218.331
R	-107.5993	2	219.1985
2	-105.8179	3	217.6357

Additive constant for all log-likelihoods = -22.05. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	12.92	6	0.04435
Test 2	6.051	3	0.1092
Test 3	6.051	3	0.1092
Test 4	3.305	2	0.1916

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. Model 2 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 162.682

BMDL = 58.0677

Default Initial Parameter Values
 alpha = 77.4849
 rho = 0 Specified
 intercept = 26.14
 v = -13.34
 n = 2.36002
 k = 35.0654

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -rho -n
 have been estimated at a boundary point, or have been specified by the user,
 and do not appear in the correlation matrix)

	alpha	intercept	v	k
alpha	1	-3.6e-009	9.8e-009	3.6e-008
intercept	-3.6e-009	1	-0.81	-0.51
v	9.8e-009	-0.81	1	0.36
k	3.6e-008	-0.51	0.36	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
alpha	64.5863	18.6445	28.0438	101.129
intercept	26.14	3.03753	20.1865	32.0935
v	-13.1569	3.7676	-20.5413	-5.77257
n	18	NA		
k	21.5963	2.68136	16.3409	26.8517

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

Dose	N	Obs Mean	Est Mean	Obs Std Dev	Est Std Dev	Scaled Res.
0	7	26.1	26.1	12.3	8.04	1.02e-008
20	4	23.5	23.5	7.04	8.04	-1.39e-007
60	6	12.8	13	6.17	8.04	-0.0558
180	7	13.1	13	7.14	8.04	0.0517

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

1 Model R: $Y_i = \mu + e(i)$
2 $\text{Var}\{e(i)\} = \sigma^2$
3
4

5 Likelihoods of Interest
6

7 Model	8 Log(likelihood)	9 # Param's	10 AIC
11 A1	-62.013133	5	134.026266
12 A2	-59.839035	8	135.678070
13 A3	-62.013133	5	134.026266
14 fitted	-62.016024	4	132.032049
15 R	-67.530040	2	139.060081

16 Explanation of Tests
17

- 18 Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
- 19 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 20 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 21 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 22 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

23 Tests of Interest
24

25 Test	26 $-2 \cdot \log(\text{Likelihood Ratio})$	27 Test df	28 p-value
29 Test 1	15.382	6	0.01748
30 Test 2	4.3482	3	0.2262
31 Test 3	4.3482	3	0.2262
32 Test 4	0.0057833	1	0.9394

33 The p-value for Test 1 is less than .05. There appears to be a
34 difference between response and/or variances among the dose levels
35 It seems appropriate to model the data
36

37 The p-value for Test 2 is greater than .1. A homogeneous variance
38 model appears to be appropriate here
39

40 The p-value for Test 3 is greater than .1. The modeled variance appears
41 to be appropriate here
42

43 The p-value for Test 4 is greater than .1. The model chosen seems
44 to adequately describe the data
45

Table 2 converting the percentage into the number of animals, and control is Control II from the study. Dose is in ng per kg and is from Table 1

The form of the probability function is:

$$P[\text{response}] = \text{background} + (1 - \text{background}) / [1 + \text{EXP}(-\text{intercept} - \text{slope} * \text{Log}(\text{dose}))]$$

Dependent variable = DichEff
 Independent variable = Dose
 Slope parameter is restricted as slope ≤ 1

Total number of observations = 5
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

User has chosen the log transformed model

-----
The form of the probability function is:

P[response] = background + (1-background)*[1-EXP(-slope*dose^power)]

Dependent variable = DichEff
Independent variable = Dose
Power parameter is restricted as power >=1

Total number of observations = 6
Total number of records with missing values = 0
Maximum number of iterations = 250
Relative Function Convergence has been set to: 1e-008
Parameter Convergence has been set to: 1e-008

Default Initial (and Specified) Parameter Values
Background = 0.0648148
Slope = 0.00246576
Power = 1.49873

Asymptotic Correlation Matrix of Parameter Estimates

( *** The model parameter(s) -Power
have been estimated at a boundary point, or have been specified by the user,
and do not appear in the correlation matrix )

Background      Slope
Background      1      -0.49
Slope           -0.49     1

Parameter Estimates

Variable      Estimate      Std. Err.      95.0% Wald Confidence Interval
Lower Conf. Limit  Upper Conf. Limit
Background    0.0893152    0.0297295    0.0310464    0.147584
Slope        0.0185641    0.00270697   0.0132586    0.0238697
Power        1            NA

NA - Indicates that this parameter has hit a bound
implied by some inequality constraint and thus
has no standard error.

Analysis of Deviance Table

The form of the probability function is:

$$P[\text{response}] = \text{Background} + (1 - \text{Background}) * \text{CumNorm}(\text{Intercept} + \text{Slope} * \text{Log}(\text{Dose})),$$

where CumNorm(.) is the cumulative normal distribution function

Dependent variable = DichEff
Independent variable = Dose
Slope parameter is not restricted

Total number of observations = 6
Total number of records with missing values = 0
Maximum number of iterations = 250
Relative Function Convergence has been set to: 1e-008
Parameter Convergence has been set to: 1e-008

```
=====
Hill Model. (Version: 2.14; Date: 06/26/2008)
=====
```

This document is a draft for review purposes only and does not constitute Agency policy.

Figure 7

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean
 Independent variable = Dose
 rho is set to 0
 Power parameter restricted to be greater than 1
 A constant variance model is fit

Total number of dose groups = 5
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

alpha =	9.96434	
rho =	0	Specified
intercept =	28.9146	
v =	-5.04512	
n =	1.44913	
k =	35.3408	

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -rho -n
 have been estimated at a boundary point, or have been specified by the user,
 and do not appear in the correlation matrix)

	alpha	intercept	v	k
alpha	1	-4.2e-009	-3.6e-008	2.3e-008
intercept	-4.2e-009	1	-0.63	-0.52
v	-3.6e-008	-0.63	1	-0.13
k	2.3e-008	-0.52	-0.13	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
alpha	9.51224	1.83063	5.92427	13.1002
intercept	28.9963	0.861586	27.3077	30.685
v	-4.77893	1.14548	-7.02403	-2.53384
n	1	NA		
k	33.2115	32.41	-30.3109	96.7338

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

39 R	-95.473923	2	194.947846

40
41
42 Explanation of Tests

- 43
44 Test 1: Do responses and/or variances differ among Dose levels?
45 (A2 vs. R)
46 Test 2: Are Variances Homogeneous? (A1 vs A2)
47 Test 3: Are variances adequately modeled? (A2 vs. A3)
48 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
49 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

50
51 Tests of Interest

52

53 Test	-2*log(Likelihood Ratio)	Test df	p-value
54 Test 1	21.6387	8	0.005631
55 Test 2	3.59074	4	0.4642
56 Test 3	3.59074	4	0.4642
57 Test 4	2.73946	2	0.2542

58
59
60 The p-value for Test 1 is less than .05. There appears to be a
61 difference between response and/or variances among the dose levels
62 It seems appropriate to model the data

63
64 The p-value for Test 2 is greater than .1. A homogeneous variance
65 model appears to be appropriate here

66
67
68 The p-value for Test 3 is greater than .1. The modeled variance appears
69 to be appropriate here

70
This document is a draft for review purposes only and does not constitute Agency policy.

1 The p-value for Test 4 is greater than .1. The model chosen seems
 2 to adequately describe the data
 3

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
Test 2: Are Variances Homogeneous? (A1 vs A2)
Test 3: Are variances adequately modeled? (A2 vs. A3)
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	12.6753	4	0.01298
Test 2	0.676025	2	0.7132
Test 3	0.676025	2	0.7132
Test 4	2.76864	1	0.09613

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Specified effect = 1
Risk Type = Estimated standard deviations from the control mean
Confidence level = 0.95
BMD = 70.7926
BMDL = 45.8305

63 Other models for which likelihoods are calculated:

64 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 65 $\text{Var}\{e(ij)\} = \sigma^2$

66 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 67 $\text{Var}\{e(ij)\} = \sigma(i)^2$

70 *This document is a draft for review purposes only and does not constitute Agency policy.*

1 Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 2 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
 3
 4 Model R: $Y_{ij} = \mu + e(i)$
 5 $\text{Var}\{e_{ij}\} = \sigma^2$
 6

7
 8 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-188.3615	6	388.7231
A2	-183.667	10	387.3339
A3	-186.1132	7	386.2263
R	-203.3606	2	410.7211
4	-186.8176	5	383.6352

19 Additive constant for all log-likelihoods = -45.95. This constant added to the
 20 above values gives the log-likelihood including the term that does not
 21 depend on the model parameters.

22
 23
 24 Explanation of Tests

25
 26 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 27 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 28 Test 3: Are variances adequately modeled? (A2 vs. A3)
 29
 30 Test 6a: Does Model 4 fit the data? (A3 vs 4)

31
 32
 33 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	39.39	8	< 0.0001
Test 2	9.389	4	0.05208
Test 3	4.892	3	0.1798
Test 6a	1.409	2	0.4944

34
 35
 36
 37
 38
 39
 40
 41
 42
 43 The p-value for Test 1 is less than .05. There appears to be a
 44 difference between response and/or variances among the dose
 45 levels, it seems appropriate to model the data.

46
 47 The p-value for Test 2 is less than .1. A non-homogeneous
 48 variance model appears to be appropriate.

49
 50 The p-value for Test 3 is greater than .1. The modeled
 51 variance appears to be appropriate here.

52
 53 The p-value for Test 6a is greater than .1. Model 4 seems
 54 to adequately describe the data.

55
 56
 57 Benchmark Dose Computations:

58 Specified Effect = 1.000000

59 Risk Type = Estimated standard deviations from control

16 Anti Response to SRBCs, PFC per 10⁶ cells, Table 4

17 ~~~~~
 18
 19 The form of the response function by Model:
 20 Model 2: Y[dose] = a * exp{sign * b * dose}
 21 Model 3: Y[dose] = a * exp{sign * (b * dose)^d}
 22 Model 4: Y[dose] = a * [c-(c-1) * exp{-b * dose}]
 23 Model 5: Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

24 Note: Y[dose] is the median response for exposure = dose;
 25 sign = +1 for increasing trend in data;
 26 sign = -1 for decreasing trend.

27
 28 Model 2 is nested within Models 3 and 4.
 29 Model 3 is nested within Model 5.
 30 Model 4 is nested within Model 5.

31
 32
 33
 34
 35 Dependent variable = Mean

1 Independent variable = Dose
 2 Data are assumed to be distributed: normally
 3 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 4 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$
 5
 6 Total number of dose groups = 5
 7 Total number of records with missing values = 0
 8 Maximum number of iterations = 250
 9 Relative Function Convergence has been set to: 1e-008
 10 Parameter Convergence has been set to: 1e-008

11 MLE solution provided: Exact

63 Other models for which likelihoods are calculated:

64 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 65 $\text{Var}\{e(ij)\} = \sigma^2$

66 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 67 $\text{Var}\{e(ij)\} = \sigma(i)^2$

70 *This document is a draft for review purposes only and does not constitute Agency policy.*

1 Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 2 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
 3
 4 Model R: $Y_{ij} = \mu + e_{ij}$
 5 $\text{Var}\{e_{ij}\} = \sigma^2$
 6

7
 8 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-444.8329	6	901.6657
A2	-425.4028	10	870.8057
A3	-435.4894	7	884.9787
R	-463.7537	2	931.5074
2	-441.2778	4	890.5555

18
 19 Additive constant for all log-likelihoods = -61.57. This constant added to the
 20 above values gives the log-likelihood including the term that does not
 21 depend on the model parameters.

22
 23
 24 Explanation of Tests

25
 26 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 27 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 28 Test 3: Are variances adequately modeled? (A2 vs. A3)
 29 Test 4: Does Model 2 fit the data? (A3 vs. 2)

30
 31
 32 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	76.7	8	< 0.0001
Test 2	38.86	4	< 0.0001
Test 3	20.17	3	0.0001563
Test 4	11.58	3	0.008983

33
 34
 35
 36
 37
 38
 39
 40
 41
 42 The p-value for Test 1 is less than .05. There appears to be a
 43 difference between response and/or variances among the dose
 44 levels, it seems appropriate to model the data.

45
 46 The p-value for Test 2 is less than .1. A non-homogeneous
 47 variance model appears to be appropriate.

48
 49 The p-value for Test 3 is less than .1. You may want to
 50 consider a different variance model.

51
 52 The p-value for Test 4 is less than .1. Model 2 may not adequately
 53 describe the data; you may want to consider another model.

54
 55
 56 Benchmark Dose Computations:

57 Specified Effect = 1.000000

58
 59 Risk Type = Estimated standard deviations from control

60 Confidence Level = 0.950000

61
 62
 63 BMD = 106.252

64
 65
 66 BMDL = 71.9153

67

User has chosen the log transformed model

Default Initial (and Specified) Parameter Values

background = 0
intercept = -1.26532
slope = 0.195762

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -background
have been estimated at a boundary point, or have been specified by the user,
and do not appear in the correlation matrix)

	intercept	slope
intercept	1	-0.87
slope	-0.87	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
background	0	NA		
intercept	-1.30013	0.240943	-1.77237	-0.827887
slope	0.202414	0.0463497	0.111571	0.293258

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Analysis of Deviance Table

Model	Log(likelihood)	# Param's	Deviance	Test d.f.	P-value

```

Tbl3, hepatic retinol

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[dose]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	8	14.9	8.768
14	8	8.4	3.394
26	8	8.2	2.263
47	8	5.1	0.8485
320	8	2.2	0.8485
1024	8	0.6	0.5657

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	10.53	5.526	2.237
14	9.589	5.073	-0.6628
26	8.855	4.717	-0.3926
47	7.714	4.159	-1.778
320	1.703	1.046	1.343
1024	0.7313	0.4833	-0.7681

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\lambda\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-87.1567	7	188.3134
A2	-47.28742	12	118.5748
A3	-55.32422	8	126.6484
R	-109.967	2	223.934
4	-69.02619	5	148.0524

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
------	--------------------------	-------	---------

This document is a draft for review purposes only and does not constitute Agency policy.

1	Test 1	125.4	10	< 0.0001
2	Test 2	79.74	5	< 0.0001
3	Test 3	16.07	4	0.002922
4	Test 6a	27.4	3	< 0.0001

7 The p-value for Test 1 is less than .05. There appears to be a
8 difference between response and/or variances among the dose
9 levels, it seems appropriate to model the data.

11 The p-value for Test 2 is less than .1. A non-homogeneous
12 variance model appears to be appropriate.

14 The p-value for Test 3 is less than .1. You may want to
15 consider a different variance model.

17 The p-value for Test 6a is less than .1. Model 4 may not adequately
18 describe the data; you may want to consider another model.

21 Benchmark Dose Computations:

22 Specified Effect = 1.000000

24 Risk Type = Estimated standard deviations from control

26 Confidence Level = 0.950000

28 BMD = 115.128

30 BMDL = 70.981

Test 3	16.07	4	0.002922
Test 7a	27.4	3	< 0.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 115.128

BMDL = 70.981

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-87.156698	7	188.313395
A2	-47.287416	12	118.574833
A3	-55.324218	8	126.648436
fitted	-56.636555	6	125.273110
R	-109.967018	2	223.934036

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	125.359	10	<.0001
Test 2	79.7386	5	<.0001
Test 3	16.0736	4	0.002922
Test 4	2.62467	2	0.2692

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

This document is a draft for review purposes only and does not constitute Agency policy.

1
2 The p-value for Test 3 is less than .1. You may want to consider a
3 different variance model
4
5 The p-value for Test 4 is greater than .1. The model chosen seems
6 to adequately describe the data

21      Test 1: Do responses and/or variances differ among Dose levels?
22              (A2 vs. R)
23      Test 2: Are Variances Homogeneous? (A1 vs A2)
24      Test 3: Are variances adequately modeled? (A2 vs. A3)
25      Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
26      (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
27
28                  Tests of Interest
29
30         Test      -2*log(Likelihood Ratio)  Test df      p-value
31
32         Test 1          160.068             10          <.0001
33         Test 2          107.598              5          <.0001
34         Test 3           1.25486             4           0.869
35         Test 4          117.556              3          <.0001
36
37      The p-value for Test 1 is less than .05. There appears to be a
38      difference between response and/or variances among the dose levels
39      It seems appropriate to model the data
40
41      The p-value for Test 2 is less than .1. A non-homogeneous variance
42      model appears to be appropriate
43
44      The p-value for Test 3 is greater than .1. The modeled variance appears
45      to be appropriate here
46
47      The p-value for Test 4 is less than .1. You may want to try a different
48      model

The form of the response function is:

$$Y[\text{dose}] = \beta_0 + \beta_1 \cdot \text{dose} + \beta_2 \cdot \text{dose}^2 + \dots$$

Dependent variable = Mean

Independent variable = Dose

Signs of the polynomial coefficients are not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\alpha + \log(\text{mean}(i))) \cdot \rho$

Total number of dose groups = 6

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

This document is a draft for review purposes only and does not constitute Agency policy.

1 lalpha = 9.57332
 2 rho = 0
 3 beta_0 = 177.506
 4 beta_1 = -0.204775

7 Asymptotic Correlation Matrix of Parameter Estimates

Model	Log(likelihood)	# Param's	AIC
A1	-250.554817	7	515.109634
A2	-196.755746	12	417.511491
A3	-197.383174	8	410.766347
fitted	-199.031154	5	408.062307
R	-276.789644	2	557.579287

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	160.068	10	<.0001
Test 2	107.598	5	<.0001
Test 3	1.25486	4	0.869
Test 4	3.29596	3	0.3482

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-250.5548	7	515.1096
A2	-196.7557	12	417.5115
A3	-250.5548	7	515.1096
R	-276.7896	2	557.5793
5	-252.3071	4	512.6141

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	160.1	10	< 0.0001
Test 2	107.6	5	< 0.0001
Test 3	107.6	5	< 0.0001
Test 7a	3.504	3	0.3202

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. Consider running a non-homogeneous variance model.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 7a is greater than .1. Model 5 seems to adequately describe the data.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

```

Tbl3, plasma FT4

```

The form of the response function by Model:
Model 2:      Y[dose] = a * exp{sign * b * dose}
Model 3:      Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:      Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:      Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[dose]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	8	23.4	3.111
14	8	24.5	5.657
26	8	22.4	2.828
47	8	19.3	9.334
320	8	16.3	4.243
1024	8	10.3	4.808

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	22.66	5.554	0.3768
14	22.4	5.536	1.073
26	22.18	5.521	0.1131
47	21.8	5.495	-1.286
320	17.4	5.17	-0.6029
1024	9.735	4.417	0.3618

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\lambda\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-102.145	7	218.2901
A2	-94.04963	12	212.0993
A3	-102.143	8	220.286
R	-117.8175	2	239.635
2	-103.7322	4	215.4645

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	47.54	10	< 0.0001

This document is a draft for review purposes only and does not constitute Agency policy.

1	Test 2	16.19	5	0.00632
2	Test 3	16.19	4	0.002778
3	Test 4	3.178	4	0.5284

6 The p-value for Test 1 is less than .05. There appears to be a
7 difference between response and/or variances among the dose
8 levels, it seems appropriate to model the data.

10 The p-value for Test 2 is less than .1. A non-homogeneous
11 variance model appears to be appropriate.

13 The p-value for Test 3 is less than .1. You may want to
14 consider a different variance model.

16 The p-value for Test 4 is greater than .1. Model 2 seems
17 to adequately describe the data.

1024	8	10.3	10.4	4.81	4.49	-0.043

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-102.145036	7	218.290071
A2	-94.049629	12	212.099258
A3	-102.143023	8	220.286046
fitted	-103.078418	6	218.156836
R	-117.817514	2	239.635028

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	47.5358	10	<.0001
Test 2	16.1908	5	0.00632
Test 3	16.1868	4	0.002778
Test 4	1.87079	2	0.3924

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a

This document is a draft for review purposes only and does not constitute Agency policy.

1 different variance model
 2

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-102.145036	7	218.290071
A2	-94.049629	12	212.099258
A3	-102.143023	8	220.286046
fitted	-103.188719	5	216.377438
R	-117.817514	2	239.635028

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	47.5358	10	<.0001
Test 2	16.1908	5	0.00632
Test 3	16.1868	4	0.002778
Test 4	2.09139	3	0.5537

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1
Risk Type = Estimated standard deviations from the control mean
Confidence level = 0.95
BMD = 175.43

BMDL = 32.1986

```

Tbl3, plasma TT4

```

The form of the response function by Model:
Model 2:      Y[dose] = a * exp{sign * b * dose}
Model 3:      Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:      Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:      Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[dose]))$
 rho is set to 0.
 A constant variance model is fit.

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

1024	24.97	6.931	0.2158

27
 28
 29 Other models for which likelihoods are calculated:

- 30
 31 Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 32
 33 Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
 34
 35 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i)) * \rho)$
 36
 37 Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 38
 39
 40
 41
 42
 43

44 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-112.0125	7	238.025
A2	-111.4015	12	246.8029
A3	-112.0125	7	238.025
R	-127.4455	2	258.891
2	-116.929	3	239.858

54
 55 Additive constant for all log-likelihoods = -44.11. This constant added to the
 56 above values gives the log-likelihood including the term that does not
 57 depend on the model parameters.
 58

59 Explanation of Tests

- 60
 61 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 62 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 63 Test 3: Are variances adequately modeled? (A2 vs. A3)
 64 Test 4: Does Model 2 fit the data? (A3 vs. 2)
 65
 66
 67

68 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	32.09	10	0.0003871
Test 2	1.222	5	0.9427
Test 3	1.222	5	0.9427
Test 4	9.833	4	0.04334

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. Model 2 may not adequately describe the data; you may want to consider another model.

Tbl3, plasma TT4

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean
 Independent variable = Dose
 rho is set to 0
 Power parameter is not restricted
 A constant variance model is fit

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250

This document is a draft for review purposes only and does not constitute Agency policy.

1 Relative Function Convergence has been set to: 1e-008
 2 Parameter Convergence has been set to: 1e-008

6 Default Initial Parameter Values
 7 alpha = 44.7333
 8 rho = 0 Specified
 9 intercept = 40.9
 10 v = -15.4
 11 n = 2.59801
 12 k = 44.9231

15 Asymptotic Correlation Matrix of Parameter Estimates

17 (*** The model parameter(s) -rho -n
 18 have been estimated at a boundary point, or have been specified by the user,
 19 and do not appear in the correlation matrix)

	alpha	intercept	v	k
alpha	1	1.6e-009	-1e-009	8.3e-008
intercept	1.6e-009	1	-0.63	-0.12
v	-1e-009	-0.63	1	-0.29
k	8.3e-008	-0.12	-0.29	1

33 Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
alpha	44.637	9.11149	26.7788	62.4952
intercept	41.2336	1.36385	38.5605	43.9067
v	-11.6836	2.15625	-15.9098	-7.45747
n	18	NA		
k	44.0222	3.14538	37.8573	50.187

43 NA - Indicates that this parameter has hit a bound
 44 implied by some inequality constraint and thus
 45 has no standard error.

21 Explanation of Tests
22

23 Test 1: Do responses and/or variances differ among Dose levels?
24 (A2 vs. R)
25 Test 2: Are Variances Homogeneous? (A1 vs A2)
26 Test 3: Are variances adequately modeled? (A2 vs. A3)
27 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
28 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)
29

30 Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	32.088	10	0.0003871
Test 2	1.22208	5	0.9427
Test 3	1.22208	5	0.9427
Test 4	6.30602	3	0.09763

31
32
33
34
35
36
37
38
39 The p-value for Test 1 is less than .05. There appears to be a
40 difference between response and/or variances among the dose levels
41 It seems appropriate to model the data
42

43 The p-value for Test 2 is greater than .1. A homogeneous variance
44 model appears to be appropriate here
45

46
47 The p-value for Test 3 is greater than .1. The modeled variance appears
48 to be appropriate here
49

50 The p-value for Test 4 is less than .1. You may want to try a different
51 model

 58 $\text{Var}\{e(ij)\} = \sigma(i)^2$

59
 60 Model A3: $Y_{ij} = \mu(i) + e(ij)$
 61 $\text{Var}\{e(ij)\} = \sigma^2$
 62 Model A3 uses any fixed variance parameters that
 63 were specified by the user

64
 65 Model R: $Y_i = \mu + e(i)$
 66 $\text{Var}\{e(i)\} = \sigma^2$

67
 68
 69 Likelihoods of Interest
 70

Model	Log(likelihood)	# Param's	AIC
A1	-112.012501	7	238.025002
A2	-111.401462	12	246.802924
A3	-112.012501	7	238.025002
fitted	-116.080583	4	240.161165
R	-127.445484	2	258.890968

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	32.088	10	0.0003871
Test 2	1.22208	5	0.9427
Test 3	1.22208	5	0.9427
Test 4	8.13616	3	0.04328

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

CONTENTS—APPENDIX F: Cancer Benchmark Dose Modeling

APPENDIX F. CANCER BENCHMARK DOSE MODELING F-1

F.1. BLOOD SERUM BMDS RESULTS F-1

F.1.1. Kociba et al. (1978): Female, Stratified Squamous Cell Carcinoma
of Hard Palate or Nasal Turbinates..... F-1

F.1.1.1. Summary Table of BMDS Modeling Results F-1

F.1.1.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-2

F.1.1.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-2

F.1.2. Kociba et al. (1978): Female, Stratified Squamous Cell Carcinoma
of Tongue..... F-4

F.1.2.1. Summary Table of BMDS Modeling Results F-4

F.1.2.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-4

F.1.2.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-5

F.1.3. Kociba et al. (1978): Female, Adenoma of Adrenal Cortex..... F-6

F.1.3.1. Summary Table of BMDS Modeling Results F-6

F.1.3.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-7

F.1.3.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-7

F.1.4. Kociba et al. (1978): Female, Hepatocellular Adenoma(s) or
Carcinoma(s)..... F-9

F.1.4.1. Summary Table of BMDS Modeling Results F-9

F.1.4.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-9

F.1.4.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-10

F.1.5. Kociba et al. (1978): Female, Stratified Squamous Cell Carcinoma
of Hard Palate or Nasal Turbinates..... F-11

F.1.5.1. Summary Table of BMDS Modeling Results F-11

F.1.5.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-12

F.1.5.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-12

F.1.6. Kociba et al. (1978): Female, Keratinizing Squamous Cell
Carcinoma of Lung F-14

F.1.6.1. Summary Table of BMDS Modeling Results F-14

F.1.6.2. Figure for Selected Model: Multistage Cancer, 1-Degree,
Betas Restricted ≥ 0 F-15

F.1.6.3. Output File for Selected Model: Multistage Cancer,
1-Degree, Betas Restricted ≥ 0 F-15

This document is a draft for review purposes only and does not constitute Agency policy.

CONTENTS (continued)

F.1.7.	National Toxicology Program (1982): Female Rat, Subcutaneous Tissue. Fibrosarcoma	F-17
F.1.7.1.	Summary Table of BMDS Modeling Results	F-17
F.1.7.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-17
F.1.7.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-18
F.1.8.	National Toxicology Program (1982): Female Rat, Liver, Neoplastic Nodule or Hepatocellular Carcinoma	F-19
F.1.8.1.	Summary Table of BMDS Modeling Results	F-19
F.1.8.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-20
F.1.8.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-20
F.1.9.	National Toxicology Program (1982): Female Rat, Adrenal, Cortical Adenoma, or Carcinoma or Adenoma, NOS	F-22
F.1.9.1.	Summary Table of BMDS Modeling Results	F-22
F.1.9.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-22
F.1.9.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-23
F.1.10.	National Toxicology Program (1982): Female Rat, Thyroid, Follicular-Cell Adenoma	F-24
F.1.10.1.	Summary Table of BMDS Modeling Results	F-24
F.1.10.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-25
F.1.10.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-25
F.1.11.	National Toxicology Program (1982): Male Rat, Liver, Neoplastic Nodule or Hepatocellular Carcinoma	F-27
F.1.11.1.	Summary Table of BMDS Modeling Results	F-27
F.1.11.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-28
F.1.11.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-28
F.1.12.	National Toxicology Program (1982): Male Ra, Thyroid, Follicular-Cell Adenoma or Carcinoma.....	F-30
F.1.12.1.	Summary Table of BMDS Modeling Results	F-30
F.1.12.2.	Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-31
F.1.12.3.	Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-31

This document is a draft for review purposes only and does not constitute Agency policy.

CONTENTS (continued)

F.1.13. National Toxicology Program (1982): Male Rat, Adrenal Cortex, Adenoma	F-33
F.1.13.1. Summary Table of BMDS Modeling Results	F-33
F.1.13.2. Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-34
F.1.13.3. Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-34
F.1.14. National Toxicology Program (1982): Female Mice, Subcutaneous Tissue, Fibrosarcoma	F-36
F.1.14.1. Summary Table of BMDS Modeling Results	F-36
F.1.14.2. Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-37
F.1.14.3. Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-37
F.1.15. National Toxicology Program (1982): Female Mice, Hematopoietic System, Lymphoma	F-39
F.1.15.1. Summary Table of BMDS Modeling Results	F-39
F.1.15.2. Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-40
F.1.15.3. Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-40
F.1.16. National Toxicology Program (1982): Female Mice, Liver, Hepatocellular Adenoma or Carcinoma.....	F-42
F.1.16.1. Summary Table of BMDS Modeling Results	F-42
F.1.16.2. Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-43
F.1.16.3. Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-43
F.1.17. National Toxicology Program (1982): Female Mice, Thyroid, Follicular-Cell Adenoma	F-45
F.1.17.1. Summary Table of BMDS Modeling Results	F-45
F.1.17.2. Figure for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-46
F.1.17.3. Output File for Selected Model: Multistage Cancer, 1-Degree, Betas Restricted ≥ 0	F-46
F.1.18. National Toxicology Program (1982): Male Mice, Lung, Alveolar/Bronchiolar Adenoma or Carcinoma.....	F-48

1 **APPENDIX G. ENDPOINTS EXCLUDED FROM REFERENCE DOSE DERIVATION**
2 **BASED ON TOXICOLOGICAL RELEVANCE**
3
4

5 The National Academy of Sciences (NAS) committee commented on the low dose model
6 predictions and the need to discuss the biological significance of the noncancer health effects
7 modeled in the 2003 Reassessment. In selecting point of departure (POD) candidates from the
8 animal bioassays for derivation of the reference dose (RfD), U.S. Environmental Protection
9 Agency (EPA) had to consider the toxicological relevance of the identified endpoint(s) from any
10 given study. Often endpoints/effects may be sensitive, but lack general toxicological
11 significance due to not being clearly adverse (defined in the Integrated Risk Information System
12 (IRIS) glossary as a biochemical change, functional impairment, or pathologic lesion that affects
13 the performance of the whole organism, or reduces an organism's ability to respond to an
14 additional environmental challenge), being an adaptive response, or not being clearly linked to
15 downstream functional or pathological alterations. It is standard EPA RfD derivation policy not
16 to base a reference value on endpoints that are not adverse or not obvious precursors to an
17 adverse effect. For select studies, a rationale for lack of toxicological relevance of particular
18 endpoints reported is listed here. These endpoints were not considered for derivation of the RfD.

19 Kitchin and Woods (1979) administered female Sprague-Dawley rats a single gavage
20 dose of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD) and measured cytochrome P450 levels and
21 benzo(a)pyrene hydroxylase (BPH) activity as a marker of hepatic microsomal cytochrome
22 P448-mediated enzyme activity. They found a statistically significant increase in BPH at doses
23 ≥ 2 ng/kg and a significant increase in cytochrome P450 levels at doses ≥ 600 ng/kg. Aryl
24 hydrocarbon hydrolase and EROD were both significantly increased 3 months after exposure;
25 however the elevation did not maintain statistical significance at 6 months. No other indicators
26 of hepatic effects were analyzed. CYP induction alone is not considered a significant
27 toxicologically adverse effect given that CYPs are induced as a means of hepatic processing of
28 xenobiotic agents. Additionally, the role of CYP induction in hepatotoxicity and carcinogenicity
29 of TCDD is unknown, and CYP induction is not considered a relevant POD without obvious
30 pathological significance.

31 In multiple studies by Hassoun et al. (1998, 2000, 2002, 2003), various indicators of
32 oxidative stress were measured in hepatic and brain tissue of female B6C3F1 mice and Sprague-

1 Mally and Chipman (2002) evaluated the effect of TCDD on gap junctions,
2 hypothesizing that as a nongenotoxic carcinogen, TCDD may induce tumor formation by
3 disturbing tissue homeostasis. Female F344 rats were dosed with TCDD by oral gavage for
4 either 3 consecutive days or 2 days a week for 28 days. Gap junction connexin (Cx) plaque
5 expression and hepatocyte proliferation was measured. The study authors report a decrease in
6 Cx32 plaque number and area in the liver of rats exposed to 0.7 ng/kg-day and higher, however
7 they did not find an associated increase in hepatocyte proliferation. No clinical signs of toxicity
8 were observed, and histological examination of the liver revealed no abnormalities. In the
9 absence of additional indicators of hepatotoxicity, a decrease in Cx32 plaque formation is not
10 clearly linked to TCDD-mediated hepatotoxicity or hepatocarcinogenicity, nor is it considered an
11 adverse effect. This endpoint is not considered a toxicologically relevant POD.

12 Vanden Heuvel et al. (1994) analyzed changes in hepatic mRNA following a single
13 administration of TCDD to female Sprague-Dawley rats by oral gavage. Four days after
14 treatment, animals were sacrificed and livers were excised. Using reverse transcriptase-
15 polymerase chain reaction (RT-PCR) on hepatic RNA, they compared levels of “dioxin
16 responsive” mRNA’s (CYP1A1, UDP-glucuronosyltransferase I, plasminogen activator inhibitor
17 2, and transforming growth factor α) at various doses of TCDD and at control (baseline) levels.
18 They determined that CYP1A1 elicited the most sensitive response to TCDD, with a statistically
19 significant increase (3-fold) in mRNA from rat livers exposed to 1 ng/kg-day TCDD. Induction
20 of CYP1A1 expression is not considered an adverse effect, as the role of CYP1A1 in
21 TCDD-mediated carcinogenicity is unsettled. Therefore, in the absence of other indicators of
22 hepatotoxicity, increases in liver CYP1A1 cannot be considered toxicologically relevant for a POD
23 candidate.

24 Devito et al. (1994) assessed the activity of CYP1A1 and CYP1A2, the amount of
25 phosphorylation of phosphotyrosyl proteins (pp32, pp34, and pp38), and the levels of estrogen
26 receptor in the liver, uterus, lung and skin tissue of female B6C3F1 mice administered TCDD for
27 5 days a week for 13 weeks. The authors hypothesized that these measurements may be
28 sensitive biomarkers for exposure to TCDD. Body weights were also recorded weekly.
29 Induction of CYP1A1 and CYP1A2, as well as increased phosphorylated forms of pp32, pp34,
30 and pp38 were sensitive indicators of TCDD exposure, with statistically significant changes seen
31 at 1.07 ng/kg-day. EROD activity in the lung, skin, and liver was also observed with significant

This document is a draft for review purposes only and does not constitute Agency policy.

1 increases at this dose. However, the authors did not find a change in rat body or terminal organ
2 weights, nor did they note any pathology in the animals at this dose level. The role of CYPs and
3 phosphorylated pp32, pp34, and pp38 in TCDD-mediated toxicity is unknown, and changes in
4 the activity or function of these proteins are not considered adverse. Therefore, these endpoints
5 are not considered suitable as PODs.

6 Because TCDD had been detected in the soil of contaminated locations, determining the
7 bioavailability of TCDD from ingested soil may be important to the calculation of safe exposure
8 levels. Lucier et al. (1986) fed adult female Sprague-Dawley rats TCDD contaminated soil or
9 gave them TCDD in corn oil at various doses and compared the effects of TCDD on biochemical
10 parameters from liver tissue. They found that equivalent doses of TCDD in corn oil and soil
11 produced similar increases in hepatic aryl hydrocarbon hydroxylase activity (AHH) and UDP
12 glucuronyltransferase activity. They determined that AHH was statistically induced 1.8-fold at
13 15 ng/kg in corn oil and 40 ng/kg in soil. Cytochrome P450 was significantly increased at higher
14 doses. No clinical signs of acute toxicity or changes in body weight were observed. The
15 association between AHH activity and TCDD-mediated hepatotoxicity is unknown and no
16 adverse endpoints were measured. Thus, this endpoint is not suitable as a POD candidate.

17 Sugita-Konishi et al. (2003) investigated the change in host resistance of mice offspring
18 lactationally exposed to TCDD. Pregnant C57BL/6NC_{ji} mice were administered TCDD via
19 drinking water from parturition to weaning of the offspring (17 days). One group of offspring
20 was then infected with *Listeria monocytogenes* and blood and spleen samples were collected
21 various time points post infection. Uninfected, TCDD exposed offspring were weighed and their
22 spleens and thymuses removed for assay of cellular content and protein expression. TCDD
23 exposure caused a statistically-significant decrease in relative spleen weight and a statistically-
24 significant increase in thymic CD4⁺ cells in the high-dose group (11.3 ng/kg-day). Offspring
25 infected with *Listeria* following TCDD exposure exhibited a statistically significant increase in
26 serum tumor necrosis factor alpha (TNF- α) 2 days after infection in both sexes in the low-
27 (1.14 ng/kg-day) and high-dose groups. The authors conclude that exposure to TCDD disrupted
28 the host resistance of the offspring at the lowest dose tested, despite the primary immune
29 parameters being unaffected. Without an obvious association between TCDD and immune
30 function, however, this endpoint is not suitable for identification of a LOAEL. Thus, the
31 LOAEL for this study is 11.3 ng/kg-day, and the NOAEL is 1.14 ng/kg-day.

This document is a draft for review purposes only and does not constitute Agency policy.

1 Sewall et al. (1993) investigated alterations in the epidermal growth factor receptor
2 (EGFR) pathway in a two-stage initiation promotion model of TCDD hepatic cancer. EGFR
3 signaling has been implicated in the altered cell growth induction by tumor promoters. Female
4 Sprague-Dawley rats were administered TCDD biweekly by oral gavage for 30 weeks following
5 initiation by a single dose of diethylnitrosamine (DEN). A group also received TCDD without
6 prior DEN initiation. Livers were harvested and fixed from sacrificed animals and sections
7 tested for EGFR binding, autophosphorylation, immunolocalization, and hepatic cell
8 proliferation. The authors report a significant dose-dependent decrease in plasma membrane
9 EGFR maximum binding capacity in TCDD-exposed rats beginning at 3.5 ng/kg-day. However,
10 at this same dose, the authors note a statistically significant decrease in cell proliferation (as
11 measured by DNA replication labeling), with increases in proliferation only occurring at higher
12 doses (125 ng/kg-day). No other indicators of hepatic toxicity or tumorigenicity were assessed.
13 The role of EGFR in TCDD-mediated hepatotoxicity and hepatocarcinogenicity is unknown, and
14 as such, this endpoint cannot be unequivocally linked to TCDD-induced hepatic effects nor
15 labeled as adverse. Thus, it is not suitable as a POD candidate.

=====
Exponential Model. (Version: 1.5; Date: 4/23/2009)
Input Data File: C:\USEPA\BMDS21\Nov23\Blood\Exp_CV_BMR1_CytC_Liver.(d)
Gnuplot Plotting File:
                                     Mon Nov 23 12:51:43 2009
=====

```

TBARs, liver only (Table 2)

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]

```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally

This document is a draft for review purposes only and does not constitute Agency policy.

Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 rho is set to 0.
 A constant variance model is fit.

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

Variable	Model 5
lnalpha	-5.48625
rho(S)	0
a	0.1387
b	4.08913e-005
c	6.40231
d	1

(S) = Specified

rho	0
a	0.156024
b	0.00016181
c	2.85354
d	2.14237

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	6	0.146	0.06614
1068	6	0.177	0.05389
2542	6	0.191	0.05634
4489	6	0.271	0.05634
7718	6	0.388	0.06369
1.396e+004	6	0.444	0.1102

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	0.156	0.0648	-0.3789
1068	0.1627	0.0648	0.5416
2542	0.1961	0.0648	-0.1919
4489	0.2705	0.0648	0.01767
7718	0.3874	0.0648	0.02225
1.396e+004	0.4443	0.0648	-0.0107

Other models for which likelihoods are calculated:

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

This document is a draft for review purposes only and does not constitute Agency policy.

1 Model A2: $Y_{ij} = \mu(i) + e_{ij}$
 2 $\text{Var}\{e_{ij}\} = \sigma(i)^2$
 3
 4 Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 5 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\mu(i))) * \rho$
 6
 7 Model R: $Y_{ij} = \mu + e(i)$
 8 $\text{Var}\{e_{ij}\} = \sigma^2$
 9

10 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	80.75258	7	-147.5052
A2	83.37355	12	-142.7471
A3	80.75258	7	-147.5052
R	55.82002	2	-107.64
5	80.51365	5	-151.0273

11 Additive constant for all log-likelihoods = -33.08. This constant added to the
 12 above values gives the log-likelihood including the term that does not
 13 depend on the model parameters.
 14

15 Explanation of Tests

16 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 17 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 18 Test 3: Are variances adequately modeled? (A2 vs. A3)

19 Test 7a: Does Model 5 fit the data? (A3 vs 5)

20 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	55.11	10	< 0.0001
Test 2	5.242	5	0.3871
Test 3	5.242	5	0.3871
Test 7a	0.4779	2	0.7875

21 The p-value for Test 1 is less than .05. There appears to be a
 22 difference between response and/or variances among the dose
 23 levels, it seems appropriate to model the data.
 24

25 The p-value for Test 2 is greater than .1. A homogeneous
 26 variance model appears to be appropriate here.
 27

28 The p-value for Test 3 is greater than .1. The modeled
 29 variance appears to be appropriate here.
 30

31 The p-value for Test 7a is greater than .1. Model 5 seems
 32 to adequately describe the data.
 33

34 Benchmark Dose Computations:

35 Specified Effect = 1.000000

36 Risk Type = Estimated standard deviations from control

37 Confidence Level = 0.950000

38 BMD = 3257.85

39 BMDL = 1709.28

1.396e+004	0.4443	0.0648	-0.0107

Other models for which likelihoods are calculated:

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$

$$\text{Var}\{e(ij)\} = \text{Sigma}(i)^2$$

Model A3: $Y_{ij} = \text{Mu}(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

Model R: $Y_{ij} = \text{Mu} + e(i)$
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	80.75258	7	-147.5052
A2	83.37355	12	-142.7471
A3	80.75258	7	-147.5052
R	55.82002	2	-107.64
5	80.51365	5	-151.0273

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	55.11	10	< 0.0001
Test 2	5.242	5	0.3871
Test 3	5.242	5	0.3871
Test 7a	0.4779	2	0.7875

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is greater than .1. Model 5 seems to adequately describe the data.

Benchmark Dose Computations:

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	80.752584	7	-147.505168
A2	83.373547	12	-142.747094
A3	80.752584	7	-147.505168
fitted	80.455153	5	-150.910305
R	55.820023	2	-107.640047

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	55.107	10	<.0001
Test 2	5.24193	5	0.3871
Test 3	5.24193	5	0.3871
Test 4	0.594862	2	0.7427

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
-------	-----------------	-----------	-----

This document is a draft for review purposes only and does not constitute Agency policy.

A1	80.752584	7	-147.505168
A2	83.373547	12	-142.747094
A3	80.752584	7	-147.505168
fitted	78.330124	4	-148.660249
R	55.820023	2	-107.640047

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	55.107	10	<.0001
Test 2	5.24193	5	0.3871
Test 3	5.24193	5	0.3871
Test 4	4.84492	3	0.1835

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

DNA single-strand breaks, liver only (Table 3)

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 rho is set to 0.
 A constant variance model is fit.

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

7718	19.87	1.617	0.7958
1.396e+004	23.59	1.617	-0.1293

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-33.14239	7	80.28478
A2	-31.81197	12	87.62394
A3	-33.14239	7	80.28478
R	-80.44209	2	164.8842
4	-35.29426	4	78.58852

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	97.26	10	< 0.0001
Test 2	2.661	5	0.7521
Test 3	2.661	5	0.7521
Test 6a	4.304	3	0.2305

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled

This document is a draft for review purposes only and does not constitute Agency policy.

1 variance appears to be appropriate here.

2
3 The p-value for Test 6a is greater than .1. Model 4 seems
4 to adequately describe the data.
5

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-33.142389	7	80.284779
A2	-31.811970	12	87.623940
A3	-33.142389	7	80.284779
fitted	-35.187895	5	80.375790
R	-80.442086	2	164.884172

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	97.2602	10	<.0001
Test 2	2.66084	5	0.7521
Test 3	2.66084	5	0.7521
Test 4	4.09101	2	0.1293

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$

Var{e(ij)} = Sigma(i)^2  
Model A3: Yij = Mu(i) + e(ij)  
Var{e(ij)} = Sigma^2  
Model A3 uses any fixed variance parameters that  
were specified by the user  
Model R: Yi = Mu + e(i)  
Var{e(i)} = Sigma^2

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -33.142389      | 7         | 80.284779  |
| A2     | -31.811970      | 12        | 87.623940  |
| A3     | -33.142389      | 7         | 80.284779  |
| fitted | -35.946581      | 4         | 79.893162  |
| R      | -80.442086      | 2         | 164.884172 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 97.2602                  | 10      | <.0001  |
| Test 2 | 2.66084                  | 5       | 0.7521  |
| Test 3 | 2.66084                  | 5       | 0.7521  |
| Test 4 | 5.60838                  | 3       | 0.1323  |

The p-value for Test 1 is less than .05. There appears to be a  
difference between response and/or variances among the dose levels  
It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance  
model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears  
to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems  
to adequately describe the data

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 249.162  
BMDL = 111.676

The form of the response function by Model:

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model 2:  $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$   
 Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 rho is set to 0.  
 A constant variance model is fit.

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| 1.396e+004 | 2.398    | 0.4016  | -0.646          |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC        |
|-------|-----------------|----|------------|
| A1    | 16.26977        | 7  | -18.53954  |
| A2    | 19.12783        | 12 | -14.25565  |
| A3    | 16.26977        | 7  | -18.53954  |
| R     | 2.44294         | 2  | -0.8858799 |
| 5     | 14.84065        | 5  | -19.6813   |

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 33.37                    | 10    | 0.000236 |
| Test 2  | 5.716                    | 5     | 0.3348   |
| Test 3  | 5.716                    | 5     | 0.3348   |
| Test 7a | 2.858                    | 2     | 0.2395   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 variance appears to be appropriate here.

2  
3 The p-value for Test 7a is greater than .1. Model 5 seems  
4 to adequately describe the data.

5

$$\text{Var}\{e(ij)\} = \text{Sigma}(i)^2$$

Model A3:  $Y_{ij} = \text{Mu}(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$   
Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \text{Mu} + e(i)$   
 $\text{Var}\{e(i)\} = \text{Sigma}^2$

#### Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | 16.269770       | 7         | -18.539539 |
| A2     | 19.127827       | 12        | -14.255654 |
| A3     | 16.269770       | 7         | -18.539539 |
| fitted | 14.967385       | 5         | -19.934770 |
| R      | 2.442940        | 2         | -0.885880  |

#### Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

#### Tests of Interest

| Test   | $-2*\log(\text{Likelihood Ratio})$ | Test df | p-value  |
|--------|------------------------------------|---------|----------|
| Test 1 | 33.3698                            | 10      | 0.000236 |
| Test 2 | 5.71611                            | 5       | 0.3348   |
| Test 3 | 5.71611                            | 5       | 0.3348   |
| Test 4 | 2.60477                            | 2       | 0.2719   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

#### Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 1813.69  
BMDL = 957.252

| 7718       | 6 | 2.62     | 2.33     | 0.517       | 0.442       | 1.62        |
| 1.396e+004 | 6 | 2.29     | 2.54     | 0.487       | 0.442       | -1.36       |

Model Descriptions for likelihoods calculated

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $Var\{e(ij)\} = \sigma^2$   
Model A3 uses any fixed variance parameters that were specified by the user
- Model R:  $Y_i = \mu + e(i)$   
 $Var\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | # Param's | AIC |
|-------|-----------------|-----------|-----|
|-------|-----------------|-----------|-----|

*This document is a draft for review purposes only and does not constitute Agency policy.*

|        |           |    |            |
|--------|-----------|----|------------|
| A1     | 16.269770 | 7  | -18.539539 |
| A2     | 19.127827 | 12 | -14.255654 |
| A3     | 16.269770 | 7  | -18.539539 |
| fitted | 11.394946 | 4  | -14.789892 |
| R      | 2.442940  | 2  | -0.885880  |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 33.3698                  | 10      | 0.000236 |
| Test 2 | 5.71611                  | 5       | 0.3348   |
| Test 3 | 5.71611                  | 5       | 0.3348   |
| Test 4 | 9.74965                  | 3       | 0.02082  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

```

The form of the response function by Model:
Model 2:      Y[dose] = a * exp(sign * b * dose)

```

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 11  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Estimated Values of Interest

| Dose       | Est Mean | Est Std | Scaled Residual |
|------------|----------|---------|-----------------|
| 0          | 5.434    | 1.375   | -1.165          |
| 69.5       | 5.478    | 1.385   | -0.8342         |
| 232        | 5.625    | 1.421   | 1.513           |
| 463        | 5.875    | 1.483   | 1.787           |
| 2318       | 8.529    | 2.127   | -0.2151         |
| 6949       | 16.87    | 4.119   | -1.392          |
| 2.319e+004 | 49.41    | 11.67   | 1.644           |
| 6.966e+004 | 119.4    | 27.44   | -1.708          |
| 2.326e+005 | 168.6    | 38.32   | -0.7087         |
| 5.819e+005 | 169.6    | 38.53   | 0.6461          |
| 2.332e+006 | 169.6    | 38.53   | 1.009           |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\lambda \alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -158.1306       | 12 | 340.2613 |
| A2    | -84.80028       | 22 | 213.6006 |
| A3    | -98.82189       | 13 | 223.6438 |
| R     | -234.6252       | 2  | 473.2504 |
| 5     | -107.2031       | 6  | 226.4062 |

Additive constant for all log-likelihoods = -45.03. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. A1)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value   |
|---------|--------------------------|-------|-----------|
| Test 1  | 299.6                    | 20    | < 0.0001  |
| Test 2  | 146.7                    | 10    | < 0.0001  |
| Test 3  | 28.04                    | 9     | 0.0009381 |
| Test 7a | 16.76                    | 7     | 0.01899   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 levels, it seems appropriate to model the data.

2  
3 The p-value for Test 2 is less than .1. A non-homogeneous  
4 variance model appears to be appropriate.

5  
6 The p-value for Test 3 is less than .1. You may want to  
7 consider a different variance model.

8  
9 The p-value for Test 7a is less than .1. Model 5 may not adequately  
10 describe the data; you may want to consider another model.

11  
12  
13 Benchmark Dose Computations:

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-158.1306	12	340.2613
A2	-84.80028	22	213.6006
A3	-98.82189	13	223.6438
R	-234.6252	2	473.2504
5	-107.2031	6	226.4062

Additive constant for all log-likelihoods = -45.03. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

This document is a draft for review purposes only and does not constitute Agency policy.

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	299.6	20	< 0.0001
Test 2	146.7	10	< 0.0001
Test 3	28.04	9	0.0009381
Test 7a	16.76	7	0.01899

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 1182.79

BMDL = 556.132

Model Descriptions for likelihoods calculated

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$   
Model A3 uses any fixed variance parameters that were specified by the user
- Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -59.086537      | 7         | 132.173073 |
| A2     | -37.515858      | 12        | 99.031716  |
| A3     | -40.906180      | 8         | 97.812359  |
| fitted | -42.452016      | 6         | 96.904031  |
| R      | -116.710291     | 2         | 237.420582 |

#### Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)
- Test 2: Are Variances Homogeneous? (A1 vs A2)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

#### Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 158.389                  | 10      | <.0001  |
| Test 2 | 43.1414                  | 5       | <.0001  |
| Test 3 | 6.78064                  | 4       | 0.1479  |
| Test 4 | 3.09167                  | 2       | 0.2131  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

#### Benchmark Dose Computation

Specified effect = 1

Risk Type = Estimated standard deviations from the control mean

Confidence level = 0.95

BMD = 423.477

BMDL = 304.577

```

0
~~~~~

The form of the response function is:

Y[dose] = intercept + v*dose^n/(k^n + dose^n)

Dependent variable = Mean
Independent variable = Dose
Power parameter is not restricted
The variance is to be modeled as Var(i) = exp(lalpha + rho * ln(mean(i)))

Total number of dose groups = 6
Total number of records with missing values = 0
Maximum number of iterations = 250
Relative Function Convergence has been set to: 1e-008
Parameter Convergence has been set to: 1e-008

```

```

Default Initial Parameter Values
lalpha = 1.59547

```

```

1 rho = 0
2 intercept = 3.614
3 v = 17.599
4 n = 2.06282
5 k = 3589.94

```

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -59.086537      | 7         | 132.173073 |
| A2     | -37.515858      | 12        | 99.031716  |
| A3     | -40.906180      | 8         | 97.812359  |
| fitted | -42.452016      | 6         | 96.904032  |
| R      | -116.710291     | 2         | 237.420582 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 158.389                  | 10      | <.0001  |
| Test 2 | 43.1414                  | 5       | <.0001  |
| Test 3 | 6.78064                  | 4       | 0.1479  |
| Test 4 | 3.09167                  | 2       | 0.2131  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

The form of the response function by Model:

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model 2:  $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$   
 Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 4     |

| 6 | 1.55e+004 | 50.02 | 10.41  | -0.4854 |

10 Other models for which likelihoods are calculated:

- 11 Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 12  $\text{Var}\{e(ij)\} = \sigma^2$   
 13  
 14 Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 15  $\text{Var}\{e(ij)\} = \sigma(i)^2$   
 16  
 17 Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 18  $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i))) * \rho$   
 19  
 20 Model R:  $Y_{ij} = \mu + e(i)$   
 21  $\text{Var}\{e(ij)\} = \sigma^2$   
 22  
 23  
 24

25 Likelihoods of Interest

| 27 Model | 28 Log(likelihood) | 29 DF    | 30 AIC   |
|----------|--------------------|----------|----------|
| 31 ----- | 32 -----           | 33 ----- | 34 ----- |
| 35 A1    | -152.0793          | 7        | 318.1586 |
| 36 A2    | -123.367           | 12       | 270.734  |
| 37 A3    | -129.5911          | 8        | 275.1823 |
| 38 R     | -206.5175          | 2        | 417.0349 |
| 39 4     | -136.0978          | 5        | 282.1956 |

40 Additive constant for all log-likelihoods = -55.14. This constant added to the  
 41 above values gives the log-likelihood including the term that does not  
 42 depend on the model parameters.

43 Explanation of Tests

- 44 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 45 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 46 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 47 Test 6a: Does Model 4 fit the data? (A3 vs 4)

48 Tests of Interest

| 50 Test    | 51 -2*log(Likelihood Ratio) | 52 D. F. | 53 p-value |
|------------|-----------------------------|----------|------------|
| 54 -----   | 55 -----                    | 56 ----- | 57 -----   |
| 58 Test 1  | 166.3                       | 10       | < 0.0001   |
| 59 Test 2  | 57.42                       | 5        | < 0.0001   |
| 60 Test 3  | 12.45                       | 4        | 0.01431    |
| 61 Test 6a | 13.01                       | 3        | 0.004608   |

62 The p-value for Test 1 is less than .05. There appears to be a  
 63 difference between response and/or variances among the dose  
 64 levels, it seems appropriate to model the data.

65 The p-value for Test 2 is less than .1. A non-homogeneous  
 66 variance model appears to be appropriate.

67 The p-value for Test 3 is less than .1. You may want to  
 68 consider a different variance model.

69 The p-value for Test 6a is less than .1. Model 4 may not adequately  
 70

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 describe the data; you may want to consider another model.

2  
3  
4 Benchmark Dose Computations:

5 Specified Effect = 1.000000

6 Risk Type = Estimated standard deviations from control

7 Confidence Level = 0.950000

8 BMD = 41.3446

9 BMDL = 28.8946

35  
36 ~~~~~

The form of the response function by Model:  
 Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
 Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
 Model 4:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-b * \text{dose}\}]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c - 1) * \exp\{-(b * \text{dose})^d\}]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 5     |
|----------|-------------|
| lnalpha  | -1.42653    |

| 1.55e+004 | 50.02 | 10.41  | -0.4854 |

Other models for which likelihoods are calculated:

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF  | AIC      |
|-------|-----------------|-----|----------|
| ----- | -----           | --- | -----    |
| A1    | -152.0793       | 7   | 318.1586 |
| A2    | -123.367        | 12  | 270.734  |
| A3    | -129.5911       | 8   | 275.1823 |
| R     | -206.5175       | 2   | 417.0349 |
| 5     | -136.0978       | 5   | 282.1956 |

Additive constant for all log-likelihoods = -55.14. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| -----   | -----                    | ---   | -----    |
| Test 1  | 166.3                    | 10    | < 0.0001 |
| Test 2  | 57.42                    | 5     | < 0.0001 |
| Test 3  | 12.45                    | 4     | 0.01431  |
| Test 7a | 13.01                    | 3     | 0.004608 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 The p-value for Test 7a is less than .1. Model 5 may not adequately  
2 describe the data; you may want to consider another model.

Y[dose] = intercept + v\*dose^n/(k^n + dose^n)

Dependent variable = Mean  
 Independent variable = Dose  
 Power parameter is not restricted  
 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \rho * \ln(\text{mean}(i)))$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = 4.17467  
 rho = 0  
 intercept = 2.071  
 v = 48.119  
 n = 18  
 k = 4322.89

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -n -k  
 have been estimated at a boundary point, or have been specified by the user,  
 and do not appear in the correlation matrix )

|           | lalpha | rho   | intercept | v     |
|-----------|--------|-------|-----------|-------|
| lalpha    | 1      | -0.95 | -0.49     | 0.11  |
| rho       | -0.95  | 1     | 0.45      | -0.22 |
| intercept | -0.49  | 0.45  | 1         | -0.15 |
| v         | 0.11   | -0.22 | -0.15     | 1     |

Parameter Estimates

| Variable  | Estimate    | Std. Err. | 95.0% Wald Confidence Interval |                   |
|-----------|-------------|-----------|--------------------------------|-------------------|
|           |             |           | Lower Conf. Limit              | Upper Conf. Limit |
| lalpha    | -1.47774    | 0.642044  | -2.73613                       | -0.219359         |
| rho       | 1.8037      | 0.187436  | 1.43633                        | 2.17107           |
| intercept | 2.071       | 0.291246  | 1.50017                        | 2.64183           |
| v         | 38.6102     | 1.9322    | 34.8232                        | 42.3972           |
| n         | 18          | NA        |                                |                   |
| k         | 1.5503e-011 | NA        |                                |                   |

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 166.301                  | 10      | <.0001  |
| Test 2 | 57.4247                  | 5       | <.0001  |
| Test 3 | 12.4483                  | 4       | 0.01431 |
| Test 4 | 23.6362                  | 3       | <.0001  |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Specified effect = 1  
Risk Type = Estimated standard deviations from the control mean  
Confidence level = 0.95  
BMD = 0.0454117  
BMDL = 0.0454112

1 **H.2.7. National Toxicology Program. (2006): Lung EROD Week 53**

2 **H.2.7.1. Summary Table of BMDS Modeling Results**

| Model                               | Degrees of Freedom | Variance $p$ -Value <sup>a</sup> | $\chi^2$ Test Statistic | $\chi^2$ $p$ -Value <sup>b</sup> | AIC           | BMD (ng/kg-day) | BMDL (ng/kg-day) | Model Notes                                                       |

The form of the response function by Model:

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model 2:  $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$   
 Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Initial Parameter Values

| Variable | Model 4     |
|----------|-------------|
| lnalpha  | -0.80064    |
| rho      | 1.47683     |
| a        | 2.86045     |
| b        | 0.000243673 |

| 5 | 8918     | 43.23 | 12.25 | 0.1192   |
| 6 | 1.6e+004 | 43.33 | 12.28 | 0.08869  |

Other models for which likelihoods are calculated:

Model A1:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}(e_{ij}) = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}(e_{ij}) = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}(e_{ij}) = \exp(\alpha + \log(\mu(i))) * \rho$

Model R:  $Y_{ij} = \mu + e_{ij}$   
 $\text{Var}(e_{ij}) = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -135.2677       | 7  | 284.5353 |
| A2    | -115.6885       | 12 | 255.3771 |
| A3    | -121.1517       | 8  | 258.3034 |
| R     | -162.0902       | 2  | 328.1805 |
| 4     | -122.9684       | 5  | 255.9369 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 92.8                     | 10    | < 0.0001 |
| Test 2  | 39.16                    | 5     | < 0.0001 |
| Test 3  | 10.93                    | 4     | 0.0274   |
| Test 6a | 3.633                    | 3     | 0.3039   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 6a is greater than .1. Model 4 seems

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 to adequately describe the data.

The form of the response function by Model:  
 Model 2:  $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$   
 Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}(e(ij)) = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}(e(ij)) = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}(e(ij)) = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R:  $Y_{ij} = \mu + e(ij)$   
 $\text{Var}(e(ij)) = \sigma^2$

| Likelihoods of Interest |                 |    |          |  |
|-------------------------|-----------------|----|----------|--|
| Model                   | Log(likelihood) | DF | AIC      |  |
| A1                      | -135.2677       | 7  | 284.5353 |  |
| A2                      | -115.6885       | 12 | 255.3771 |  |
| A3                      | -121.1517       | 8  | 258.3034 |  |
| R                       | -162.0902       | 2  | 328.1805 |  |
| 5                       | -122.4411       | 6  | 256.8821 |  |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 92.8                     | 10    | < 0.0001 |
| Test 2  | 39.16                    | 5     | < 0.0001 |
| Test 3  | 10.93                    | 4     | 0.0274   |
| Test 7a | 2.579                    | 2     | 0.2755   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

1 The p-value for Test 7a is greater than .1. Model 5 seems  
2 to adequately describe the data.

Y[dose] = intercept + v\*dose^n/(k^n + dose^n)

Dependent variable = Mean  
 Independent variable = Dose  
 Power parameter is not restricted  
 The variance is to be modeled as  $\text{Var}(i) = \exp(\text{lalpha} + \rho * \ln(\text{mean}(i)))$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = 4.76968  
 rho = 0  
 intercept = 3.011  
 v = 40.735  
 n = 2.49974  
 k = 1565.11

Asymptotic Correlation Matrix of Parameter Estimates

( \*\*\* The model parameter(s) -k  
 have been estimated at a boundary point, or have been specified by the user,  
 and do not appear in the correlation matrix )

|           | lalpha | rho   | intercept | v     | n  |
|-----------|--------|-------|-----------|-------|----|
| lalpha    | 1      | -0.96 | -0.5      | 0.17  | NA |
| rho       | -0.96  | 1     | 0.47      | -0.25 | NA |
| intercept | -0.5   | 0.47  | 1         | -0.25 | NA |
| v         | 0.17   | -0.25 | -0.25     | 1     | NA |
| n         | NA     | NA    | NA        | NA    | NA |

NA - This parameter's variance has been estimated as zero or less.  
 THE MODEL HAS PROBABLY NOT CONVERGED!!!

Parameter Estimates

| Variable  | Estimate     | Std. Err. | 95.0% Wald Confidence Interval |                   |
|-----------|--------------|-----------|--------------------------------|-------------------|
|           |              |           | Lower Conf. Limit              | Upper Conf. Limit |
| lalpha    | -1.07501     | NA        | NA                             | NA                |
| rho       | 1.68859      | NA        | NA                             | NA                |
| intercept | 3.011        | NA        | NA                             | NA                |
| v         | 35.7938      | NA        | NA                             | NA                |
| n         | 5.85653      | NA        | NA                             | NA                |
| k         | 2.91999e-005 | NA        |                                |                   |

At least some variance estimates are negative.  
 THIS USUALLY MEANS THE MODEL HAS NOT CONVERGED!  
 Try again from another starting point.

Table of Data and Estimated Values of Interest

| 1.6e+004 | 8 | 43.7 | 38.8 | 6.32 | 12.8 | 1.08       |

Model Descriptions for likelihoods calculated

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$   
 Model A3 uses any fixed variance parameters that were specified by the user

Model R:  $Y_i = \mu + e(i)$   
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -135.267662     | 7         | 284.535325 |
| A2     | -115.688533     | 12        | 255.377067 |
| A3     | -121.151707     | 8         | 258.303413 |
| fitted | -129.200555     | 5         | 268.401110 |
| R      | -162.090242     | 2         | 328.180484 |

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
  - Test 2: Are Variances Homogeneous? (A1 vs A2)
  - Test 3: Are variances adequately modeled? (A2 vs. A3)
  - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value  |
|--------|--------------------------|---------|----------|
| Test 1 | 92.8034                  | 10      | <.0001   |
| Test 2 | 39.1583                  | 5       | <.0001   |
| Test 3 | 10.9263                  | 4       | 0.0274   |
| Test 4 | 16.0977                  | 3       | 0.001083 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Var{e(ij)} = Sigma(i)^2  
Model A3: Yij = Mu(i) + e(ij)  
Var{e(ij)} = exp(lalpha + rho\*ln(Mu(i)))  
Model A3 uses any fixed variance parameters that  
were specified by the user  
Model R: Yi = Mu + e(i)  
Var{e(i)} = Sigma^2

Likelihoods of Interest

| Model  | Log(likelihood) | # Param's | AIC        |
|--------|-----------------|-----------|------------|
| A1     | -135.267662     | 7         | 284.535325 |
| A2     | -115.688533     | 12        | 255.377067 |
| A3     | -121.151707     | 8         | 258.303413 |
| fitted | -125.533162     | 5         | 261.066325 |
| R      | -162.090242     | 2         | 328.180484 |

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?  
(A2 vs. R)  
Test 2: Are Variances Homogeneous? (A1 vs A2)  
Test 3: Are variances adequately modeled? (A2 vs. A3)  
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)  
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 92.8034                  | 10      | <.0001  |
| Test 2 | 39.1583                  | 5       | <.0001  |
| Test 3 | 10.9263                  | 4       | 0.0274  |
| Test 4 | 8.76291                  | 3       | 0.03261 |

The p-value for Test 1 is less than .05. There appears to be a  
difference between response and/or variances among the dose levels  
It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance  
model appears to be appropriate

The p-value for Test 3 is less than .1. You may want to consider a  
different variance model

The p-value for Test 4 is less than .1. You may want to try a different  
model

Exponential Model. (Version: 1.5; Date: 4/23/2009)
Input Data File: C:\USEPA\BMDS21\AD\Blood\Exp_BMR1_Tbl11_31wk.(d)
Gnuplot Plotting File:
                                     Thu Nov 19 11:23:48 2009
=====
  
```

Tbl 11, 31wk, Hep Cell Proliferation Labeling Index

```

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

Note: Y[dose] is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally

*This document is a draft for review purposes only and does not constitute Agency policy.*

Variance Model:  $\exp(\ln\alpha + \rho \cdot \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) \cdot \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Other models for which likelihoods are calculated:

Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model A3:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e_{ij}\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -47.23498       | 7  | 108.47   |
| A2    | -8.679256       | 12 | 41.35851 |
| A3    | -8.980651       | 8  | 33.9613  |
| R     | -63.44829       | 2  | 130.8966 |
| 2     | -19.27346       | 4  | 46.54692 |

Additive constant for all log-likelihoods = -54.22. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

| Test   | -2*log(Likelihood Ratio) | D. F. | p-value   |
|--------|--------------------------|-------|-----------|
| Test 1 | 109.5                    | 10    | < 0.0001  |
| Test 2 | 77.11                    | 5     | < 0.0001  |
| Test 3 | 0.6028                   | 4     | 0.9628    |
| Test 4 | 20.59                    | 4     | 0.0003826 |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. Model 2 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 4772.05

BMDL = 3816.47

The form of the response function by Model:

*This document is a draft for review purposes only and does not constitute Agency policy.*

Model 2:  $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$   
 Model 3:  $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$   
 Model 4:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e(ij)$   
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC      |
|-------|-----------------|----|----------|
| A1    | -9.701316       | 7  | 33.40263 |
| A2    | 4.934967        | 12 | 14.13007 |
| A3    | 2.296438        | 8  | 11.40712 |
| R     | -29.51921       | 2  | 63.03841 |
| 4     | 1.548351        | 5  | 6.903297 |

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)  
 Test 2: Are Variances Homogeneous? (A2 vs. A1)  
 Test 3: Are variances adequately modeled? (A2 vs. A3)  
 Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 68.91                    | 10    | < 0.0001 |
| Test 2  | 29.27                    | 5     | < 0.0001 |
| Test 3  | 5.277                    | 4     | 0.26     |
| Test 6a | 1.496                    | 3     | 0.6832   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is greater than .1. Model 4 seems

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 to adequately describe the data.

The form of the response function by Model:  
 Model 2:  $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$   
 Model 3:  $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$   
 Model 4:  $Y[\text{dose}] = a * [c - (c-1) * \exp\{-b * \text{dose}\}]$   
 Model 5:  $Y[\text{dose}] = a * [c - (c-1) * \exp\{-(b * \text{dose})^d\}]$

Note:  $Y[\text{dose}]$  is the median response for exposure = dose;  
 sign = +1 for increasing trend in data;  
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
 Model 3 is nested within Model 5.  
 Model 4 is nested within Model 5.

Dependent variable = Mean  
 Independent variable = Dose  
 Data are assumed to be distributed: normally  
 Variance Model:  $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$   
 The variance is to be modeled as  $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6  
 Total number of records with missing values = 0  
 Maximum number of iterations = 250  
 Relative Function Convergence has been set to: 1e-008  
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

29 Explanation of Tests

- 30  
31 Test 1: Do responses and/or variances differ among Dose levels?  
32 (A2 vs. R)
- 33 Test 2: Are Variances Homogeneous? (A1 vs A2)
- 34 Test 3: Are variances adequately modeled? (A2 vs. A3)
- 35 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- 36 (Note: When  $\rho=0$  the results of Test 3 and Test 2 will be the same.)

37  
38  
39 Tests of Interest

| Test   | -2*log(Likelihood Ratio) | Test df | p-value |
|--------|--------------------------|---------|---------|
| Test 1 | 68.9083                  | 10      | <.0001  |
| Test 2 | 29.2726                  | 5       | <.0001  |
| Test 3 | 5.27706                  | 4       | 0.26    |
| Test 4 | 1.22446                  | 2       | 0.5421  |

40  
41  
42 The p-value for Test 1 is less than .05. There appears to be a  
43 difference between response and/or variances among the dose levels  
44 It seems appropriate to model the data

45  
46  
47 The p-value for Test 2 is less than .1. A non-homogeneous variance  
48 model appears to be appropriate

49  
50  
51 The p-value for Test 3 is greater than .1. The modeled variance appears  
52 to be appropriate here

53  
54  
55 The p-value for Test 4 is greater than .1. The model chosen seems  
56 to adequately describe the data

57

~~~~~  
The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean
Independent variable = Dose
The power is not restricted
The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$

Total number of dose groups = 6
Total number of records with missing values = 0
Maximum number of iterations = 250
Relative Function Convergence has been set to: 1e-008
Parameter Convergence has been set to: 1e-008

Model Descriptions for likelihoods calculated

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user
- Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
-------	-----------------	-----------	-----

This document is a draft for review purposes only and does not constitute Agency policy.

A1	-9.701316	7	33.402631
A2	4.934967	12	14.130066
A3	2.296438	8	11.407124
fitted	-0.712209	5	11.424417
R	-29.519205	2	63.038411

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	68.9083	10	<.0001
Test 2	29.2726	5	<.0001
Test 3	5.27706	4	0.26
Test 4	6.01729	3	0.1108

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 1286.41

Tbl2, UGT_1A1

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean

Independent variable = Dose

Power parameter is not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \text{rho} * \ln(\text{mean}(i)))$

This document is a draft for review purposes only and does not constitute Agency policy.

Total number of dose groups = 5
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

Tbl2, UGT_1A1

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean

Independent variable = Dose

The power is not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$

Total number of dose groups = 5

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

This document is a draft for review purposes only and does not constitute Agency policy.

lalpha = 8.57191
 rho = 0
 control = 101
 slope = 19.8524
 power = 0.225107

Asymptotic Correlation Matrix of Parameter Estimates

	lalpha	rho	control	slope	power
lalpha	1	-0.99	-0.22	0.0058	0.021
rho	-0.99	1	0.21	0.024	-0.057
control	-0.22	0.21	1	-0.14	0.11
slope	0.0058	0.024	-0.14	1	-0.99

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-68.748326	6	149.496653

This document is a draft for review purposes only and does not constitute Agency policy.

A2	-58.691256	10	137.382511
A3	-64.899072	7	143.798144
fitted	-67.875596	5	145.751193
R	-80.722651	2	165.445302

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	44.0628	8	<.0001
Test 2	20.1141	4	0.0004741
Test 3	12.4156	3	0.006087
Test 4	5.95305	2	0.05097

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

$$\text{Var}\{e(ij)\} = \text{Sigma}(i)^2$$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-572.4744	8	1160.949
A2	-290.7965	14	609.5929
A3	-293.806	9	605.6119
R	-603.6646	2	1211.329
5	-311.4203	6	634.8406

Additive constant for all log-likelihoods = -55.14. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	625.7	12	< 0.0001
Test 2	563.4	6	< 0.0001
Test 3	6.019	5	0.3044
Test 7a	35.23	3	< 0.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 449.252

BMDL = 332.057

This document is a draft for review purposes only and does not constitute Agency policy.

2
3
4 The form of the response function by Model:
5 Model 2: Y[dose] = a * exp(sign * b * dose)
6 Model 3: Y[dose] = a * exp(sign * (b * dose)^d)
7 Model 4: Y[dose] = a * [c-(c-1) * exp(-b * dose)]
8 Model 5: Y[dose] = a * [c-(c-1) * exp(-(b * dose)^d)]

9
10 Note: Y[dose] is the median response for exposure = dose;
11 sign = +1 for increasing trend in data;
12 sign = -1 for decreasing trend.

13 Model 2 is nested within Models 3 and 4.
14 Model 3 is nested within Model 5.
15 Model 4 is nested within Model 5.

16
17
18 Dependent variable = Mean
19 Independent variable = Dose
20 Data are assumed to be distributed: normally
21 Variance Model: exp(lnalpha +rho *ln(Y[dose]))
22 rho is set to 0.
23 A constant variance model is fit.

24
25 Total number of dose groups = 6
26 Total number of records with missing values = 0
27 Maximum number of iterations = 250
28 Relative Function Convergence has been set to: 1e-008
29 Parameter Convergence has been set to: 1e-008

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	0.1413	0.06591	0.1762
3	0.1646	0.06591	0.4609
10	0.2131	0.06591	-0.8196
22	0.2796	0.06591	-0.3199
46	0.3676	0.06591	0.7587
100	0.4509	0.06591	-0.2564

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}\{e_{ij}\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}\{e_{ij}\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e_{ij}\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	80.75258	7	-147.5052
A2	83.37355	12	-142.7471
A3	80.75258	7	-147.5052
R	55.82002	2	-107.64
4	79.90337	4	-151.8067

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	55.11	10	< 0.0001
Test 2	5.242	5	0.3871
Test 3	5.242	5	0.3871
Test 6a	1.698	3	0.6373

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous

This document is a draft for review purposes only and does not constitute Agency policy.

1 variance model appears to be appropriate here.

2
3 The p-value for Test 3 is greater than .1. The modeled
4 variance appears to be appropriate here.

5
6 The p-value for Test 6a is greater than .1. Model 4 seems
7 to adequately describe the data.
8

Test 3	5.24193	5	0.3871
Test 4	0.600505	2	0.7406

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data

DNA single-strand breaks, liver only (Table 3)
~~~~~

The form of the response function by Model:
Model 2: Y[dose] = a * exp{sign * b * dose}
Model 3: Y[dose] = a * exp{sign * (b * dose)^d}

```

This document is a draft for review purposes only and does not constitute Agency policy.

Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp\{-(b * \text{dose})^d\}]$

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 rho is set to 0.
 A constant variance model is fit.

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

	46	20.37	1.714	0.04957
	100	23.4	1.714	0.1459

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}(e(ij)) = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}(e(ij)) = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}(e(ij)) = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R: $Y_{ij} = \mu + e(ij)$
 $\text{Var}(e(ij)) = \sigma^2$

Likelihoods of Interest				
Model	Log(likelihood)	DF	AIC	
-----	-----	---	-----	
A1	-33.14239	7	80.28478	
A2	-31.81197	12	87.62394	
A3	-33.14239	7	80.28478	
R	-80.44209	2	164.8842	
5	-37.40682	4	82.81364	

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
-----	-----	---	-----
Test 1	97.26	10	< 0.0001
Test 2	2.661	5	0.7521
Test 3	2.661	5	0.7521
Test 7a	8.529	3	0.03626

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

1 The p-value for Test 7a is less than .1. Model 5 may not adequately
2 describe the data; you may want to consider another model.

R	-80.442086	2	164.884172

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?
 (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2*\log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	97.2602	10	<.0001
Test 2	2.66084	5	0.7521
Test 3	2.66084	5	0.7521
Test 4	7.12177	3	0.06812

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. You may want to try a different model.

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
-------	-----------------	-----------	-----

This document is a draft for review purposes only and does not constitute Agency policy.

A1	-33.142389	7	80.284779
A2	-31.811970	12	87.623940
A3	-33.142389	7	80.284779
fitted	-35.694033	4	79.388067
R	-80.442086	2	164.884172

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	97.2602	10	<.0001
Test 2	2.66084	5	0.7521
Test 3	2.66084	5	0.7521
Test 4	5.10329	3	0.1644

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

TBARS, liver only (Table 2)

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 rho is set to 0.
 A constant variance model is fit.

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest			
Model	Log(likelihood)	DF	AIC
A1	16.26977	7	-18.53954
A2	19.12783	12	-14.25565
A3	16.26977	7	-18.53954
R	2.44294	2	-0.8858799
4	14.5907	4	-21.18141

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	33.37	10	0.000236
Test 2	5.716	5	0.3348
Test 3	5.716	5	0.3348
Test 6a	3.358	3	0.3396

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled

This document is a draft for review purposes only and does not constitute Agency policy.

1 variance appears to be appropriate here.

2
3 The p-value for Test 6a is greater than .1. Model 4 seems
4 to adequately describe the data.

~~~~~

The form of the response function by Model:  
Model 2: Y[dose] = a \* exp(sign \* b \* dose)  
Model 3: Y[dose] = a \* exp(sign \* (b \* dose)^d)  
Model 4: Y[dose] = a \* [c-(c-1) \* exp(-b \* dose)]  
Model 5: Y[dose] = a \* [c-(c-1) \* exp(-(b \* dose)^d)]

Note: Y[dose] is the median response for exposure = dose;  
sign = +1 for increasing trend in data;  
sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.  
Model 3 is nested within Model 5.  
Model 4 is nested within Model 5.

Dependent variable = Mean  
Independent variable = Dose  
Data are assumed to be distributed: normally  
Variance Model: exp(lnalpha +rho \*ln(Y[dose]))  
rho is set to 0.  
A constant variance model is fit.

Total number of dose groups = 6  
Total number of records with missing values = 0  
Maximum number of iterations = 250  
Relative Function Convergence has been set to: 1e-008  
Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Estimated Values of Interest

| Dose | Est Mean | Est Std | Scaled Residual |
|------|----------|---------|-----------------|
| 0    | 1.465    | 0.4016  | 0.02326         |
| 3    | 1.554    | 0.4016  | -0.03103        |
| 10   | 2.147    | 0.4016  | 0.02011         |
| 22   | 2.397    | 0.4016  | -0.7145         |
| 46   | 2.398    | 0.4016  | 1.348           |
| 100  | 2.398    | 0.4016  | -0.6461         |

Other models for which likelihoods are calculated:

- Model A1:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}\{e_{ij}\} = \sigma^2$
- Model A2:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}\{e_{ij}\} = \sigma(i)^2$
- Model A3:  $Y_{ij} = \mu(i) + e_{ij}$   
 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R:  $Y_{ij} = \mu + e(i)$   
 $\text{Var}\{e_{ij}\} = \sigma^2$

Likelihoods of Interest

| Model | Log(likelihood) | DF | AIC        |
|-------|-----------------|----|------------|
| A1    | 16.26977        | 7  | -18.53954  |
| A2    | 19.12783        | 12 | -14.25565  |
| A3    | 16.26977        | 7  | -18.53954  |
| R     | 2.44294         | 2  | -0.8858799 |
| 5     | 14.8407         | 5  | -19.68141  |

Additive constant for all log-likelihoods = -33.08. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

| Test    | -2*log(Likelihood Ratio) | D. F. | p-value  |
|---------|--------------------------|-------|----------|
| Test 1  | 33.37                    | 10    | 0.000236 |
| Test 2  | 5.716                    | 5     | 0.3348   |
| Test 3  | 5.716                    | 5     | 0.3348   |
| Test 7a | 2.858                    | 2     | 0.2395   |

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous

*This document is a draft for review purposes only and does not constitute Agency policy.*

1 variance model appears to be appropriate here.

2  
3 The p-value for Test 3 is greater than .1. The modeled  
4 variance appears to be appropriate here.

5  
6 The p-value for Test 7a is greater than .1. Model 5 seems  
7 to adequately describe the data.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	16.269770	7	-18.539539
A2	19.127827	12	-14.255654
A3	16.269770	7	-18.539539
fitted	14.966039	5	-19.932079
R	2.442940	2	-0.885880

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels?
 (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2*\log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	33.3698	10	0.000236
Test 2	5.71611	5	0.3348
Test 3	5.71611	5	0.3348
Test 4	2.60746	2	0.2715

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is greater than .1. A homogeneous variance model appears to be appropriate here.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

19 Explanation of Tests

20
21 Test 1: Do responses and/or variances differ among Dose levels?
22 (A2 vs. R)
23 Test 2: Are Variances Homogeneous? (A1 vs A2)
24 Test 3: Are variances adequately modeled? (A2 vs. A3)
25 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
26 (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)
27

28 Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	33.3698	10	0.000236
Test 2	5.71611	5	0.3348
Test 3	5.71611	5	0.3348
Test 4	9.54627	3	0.02284

30
31
32 The p-value for Test 1 is less than .05. There appears to be a
33 difference between response and/or variances among the dose levels
34 It seems appropriate to model the data

35
36
37 The p-value for Test 2 is greater than .1. A homogeneous variance
38 model appears to be appropriate here

39
40
41 The p-value for Test 3 is greater than .1. The modeled variance appears
42 to be appropriate here

43
44
45 The p-value for Test 4 is less than .1. You may want to try a different
46 model

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 11
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-158.1306	12	340.2613
A2	-84.80028	22	213.6006
A3	-98.82189	13	223.6438
R	-234.6252	2	473.2504
5	-107.1994	6	226.3987

Additive constant for all log-likelihoods = -45.03. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-158.130647	12	340.261294
A2	-84.800279	22	213.600558
A3	-98.821893	13	223.643786
fitted	-247.263464	6	506.526928
R	-234.625213	2	473.250426

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A1 vs A2)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
------	--	---------	---------

This document is a draft for review purposes only and does not constitute Agency policy.

Test 1	299.65	20	<.0001
Test 2	146.661	10	<.0001
Test 3	28.0432	9	0.0009381
Test 4	296.883	7	<.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is less than .1. You may want to try a different model.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 1.#QNAN

BMDL computation failed.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-59.086537	7	132.173073
A2	-37.515858	12	99.031716
A3	-40.906180	8	97.812359
fitted	-42.430348	6	96.860697
R	-116.710291	2	237.420582

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	158.389	10	<.0001
Test 2	43.1414	5	<.0001
Test 3	6.78064	4	0.1479
Test 4	3.04834	2	0.2178

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears

This document is a draft for review purposes only and does not constitute Agency policy.

1 to be appropriate here

2
3 The p-value for Test 4 is greater than .1. The model chosen seems
4 to adequately describe the data

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean
 Independent variable = Dose
 Power parameter is not restricted
 The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \rho * \ln(\text{mean}(i)))$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha = 1.59547
 rho = 0
 intercept = 3.614
 v = 17.599
 n = 1.38584
 k = 12.1933

Asymptotic Correlation Matrix of Parameter Estimates

	lalpha	rho	intercept	v	n	k
lalpha	1	-0.96	-0.16	0.086	-0.057	0.041

1
2 Model Descriptions for likelihoods calculated

3
4
5 Model A1: $Y_{ij} = \mu(i) + e(ij)$
6 $\text{Var}\{e(ij)\} = \sigma^2$

7
8 Model A2: $Y_{ij} = \mu(i) + e(ij)$
9 $\text{Var}\{e(ij)\} = \sigma(i)^2$

10
11 Model A3: $Y_{ij} = \mu(i) + e(ij)$
12 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
13 Model A3 uses any fixed variance parameters that
14 were specified by the user

15
16 Model R: $Y_i = \mu + e(i)$
17 $\text{Var}\{e(i)\} = \sigma^2$

18
19
20 Likelihoods of Interest

21

Model	Log(likelihood)	# Param's	AIC
A1	-59.086537	7	132.173073
A2	-37.515858	12	99.031716
A3	-40.906180	8	97.812359
fitted	-42.430348	6	96.860697
R	-116.710291	2	237.420582

30 Explanation of Tests

- 31
32 Test 1: Do responses and/or variances differ among Dose levels?
33 (A2 vs. R)
34 Test 2: Are Variances Homogeneous? (A1 vs A2)
35 Test 3: Are variances adequately modeled? (A2 vs. A3)
36 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
37 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

38
39 Tests of Interest

40

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	158.389	10	<.0001
Test 2	43.1414	5	<.0001
Test 3	6.78064	4	0.1479
Test 4	3.04834	2	0.2178

41
42
43
44
45
46
47

48 The p-value for Test 1 is less than .05. There appears to be a
49 difference between response and/or variances among the dose levels
50 It seems appropriate to model the data

51
52 The p-value for Test 2 is less than .1. A non-homogeneous variance
53 model appears to be appropriate

54
55 The p-value for Test 3 is greater than .1. The modeled variance appears
56 to be appropriate here

57
58 The p-value for Test 4 is greater than .1. The model chosen seems
59 to adequately describe the data

60
61
62 Benchmark Dose Computation

63
64 Specified effect = 1
65
66 Risk Type = Estimated standard deviations from the control mean
67
68 Confidence level = 0.95
69
70 BMD = 0.536614

 =====

The form of the response function by Model:

- Model 2: $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$
- Model 3: $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$
- Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp\{-b * \text{dose}\}]$
- Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp\{-(b * \text{dose})^d\}]$

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

- Model 2 is nested within Models 3 and 4.
- Model 3 is nested within Model 5.
- Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

22	10	50.19	8.68
46	10	49.07	13.91

This document is a draft for review purposes only and does not constitute Agency policy.

100 10 48.42 8.933

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	2.124	0.8823	-0.1915
3	21.91	5.779	1.88
10	40.72	9.524	-3.432
22	46.73	10.64	1.029
46	47.39	10.76	0.4921
100	47.4	10.76	0.3006

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-152.0793	7	318.1586
A2	-123.367	12	270.734
A3	-129.5911	8	275.1823
R	-206.5175	2	417.0349
4	-139.9927	5	289.9853

Additive constant for all log-likelihoods = -55.14. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	166.3	10	< 0.0001
Test 2	57.42	5	< 0.0001
Test 3	12.45	4	0.01431
Test 6a	20.8	3	0.0001157

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

This document is a draft for review purposes only and does not constitute Agency policy.

1 The p-value for Test 2 is less than .1. A non-homogeneous
2 variance model appears to be appropriate.

3
4 The p-value for Test 3 is less than .1. You may want to
5 consider a different variance model.

6
7 The p-value for Test 6a is less than .1. Model 4 may not adequately
8 describe the data; you may want to consider another model.

9
10
11 Benchmark Dose Computations:

12 Specified Effect = 1.000000

13 Risk Type = Estimated standard deviations from control

14 Confidence Level = 0.950000

15 BMD = 0.102798

16 BMDL = 0.069311

Tbl 12, Week 31, Lung Microsomes EROD

The form of the response function is:

$$Y[\text{dose}] = \text{intercept} + v \cdot \text{dose}^n / (k^n + \text{dose}^n)$$

Dependent variable = Mean

Independent variable = Dose

Power parameter is not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \text{rho} * \ln(\text{mean}(i)))$

Total number of dose groups = 6

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

lalpha =	4.17467
rho =	0
intercept =	2.071
v =	48.119
n =	18
k =	15.9059

Asymptotic Correlation Matrix of Parameter Estimates

(*** The model parameter(s) -n have been estimated at a boundary point, or have been specified by the user, and do not appear in the correlation matrix)

	lalpha	rho	intercept	v	k
lalpha	1	-0.98	0.04	-0.054	-0.092
rho	-0.98	1	-0.027	0.046	0.096
intercept	0.04	-0.027	1	-0.82	0.36
v	-0.054	0.046	-0.82	1	-0.16
k	-0.092	0.096	0.36	-0.16	1

Parameter Estimates

Variable	Estimate	Std. Err.	95.0% Wald Confidence Interval	
			Lower Conf. Limit	Upper Conf. Limit
lalpha	5.40756	1.03169	3.38548	7.42964
rho	-0.228427	0.299513	-0.815462	0.358608
intercept	13.5736	2.48089	8.71112	18.436
v	35.6207	3.03486	29.6725	41.5689
n	18	NA		
k	10.0457	0.22238	9.60987	10.4816

NA - Indicates that this parameter has hit a bound implied by some inequality constraint and thus has no standard error.

Table of Data and Estimated Values of Interest

Dose	N	Obs Mean	Est Mean	Obs Std Dev	Est Std Dev	Scaled Res.
------	---	----------	----------	-------------	-------------	-------------

This document is a draft for review purposes only and does not constitute Agency policy.

0	10	2.07	13.6	0.971	11.1	-3.28
3	10	25.3	13.6	2.55	11.1	3.36
10	10	30.4	30.7	5.83	10.1	-0.0833
22	10	50.2	49.2	8.68	9.57	0.329
46	10	49.1	49.2	13.9	9.57	-0.0424
100	10	48.4	49.2	8.93	9.57	-0.255

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-152.079318	7	318.158637
A2	-123.366985	12	270.733969
A3	-129.591134	8	275.182269
fitted	-169.011448	5	348.022896
R	-206.517459	2	417.034919

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	166.301	10	<.0001
Test 2	57.4247	5	<.0001
Test 3	12.4483	4	0.01431
Test 4	78.8406	3	<.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is less than .1. You may want to consider a different variance model

The p-value for Test 4 is less than .1. You may want to try a different model

Benchmark Dose Computation

This document is a draft for review purposes only and does not constitute Agency policy.

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 9.61218

BMDL computation failed.

Tbl 12, Week 53, Lung Microsomes EROD

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

rho	1.47683
a	2.86045
b	0.0390303
c	16.0581
d	1

Parameter Estimates

Variable	Model 4
lnalpha	-1.07501
rho	1.68859
a	3.011
b	3.22004
c	12.8877
d	18

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	8	3.011	1.584
3	8	27.15	5.269
10	8	42.85	11.15
22	8	36.57	12.99
46	8	43.75	18.55
100	8	43.71	6.322

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
------	----------	---------	-----------------

This document is a draft for review purposes only and does not constitute Agency policy.

0	3.068	1.404	-0.1156
3	26.26	8.088	0.3111
10	40.44	11.5	0.5912
22	42.43	11.96	-1.386
46	42.49	11.98	0.2969
100	42.49	11.98	0.2891

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R: $Y_{ij} = \mu + e_{ij}$
 $\text{Var}(e_{ij}) = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-135.2677	7	284.5353
A2	-115.6885	12	255.3771
A3	-121.1517	8	258.3034
R	-162.0902	2	328.1805
4	-122.5608	5	255.1215

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 Test 3: Are variances adequately modeled? (A2 vs. A3)
 Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	92.8	10	< 0.0001
Test 2	39.16	5	< 0.0001
Test 3	10.93	4	0.0274
Test 6a	2.818	3	0.4205

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 6a is greater than .1. Model 4 seems

This document is a draft for review purposes only and does not constitute Agency policy.

1 to adequately describe the data.

The form of the response function by Model:
 Model 2: $Y[\text{dose}] = a * \exp\{\text{sign} * b * \text{dose}\}$
 Model 3: $Y[\text{dose}] = a * \exp\{\text{sign} * (b * \text{dose})^d\}$
 Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp\{-b * \text{dose}\}]$
 Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp\{-(b * \text{dose})^d\}]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R: $Y_{ij} = \mu + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest				
Model	Log(likelihood)	DF	AIC	
-----	-----	---	-----	
A1	-135.2677	7	284.5353	
A2	-115.6885	12	255.3771	
A3	-121.1517	8	258.3034	
R	-162.0902	2	328.1805	
5	-129.2006	6	270.4011	

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
-----	-----	---	-----
Test 1	92.8	10	< 0.0001
Test 2	39.16	5	< 0.0001
Test 3	10.93	4	0.0274
Test 7a	16.1	2	0.0003195

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

1 The p-value for Test 7a is less than .1. Model 5 may not adequately
2 describe the data; you may want to consider another model.

Model Descriptions for likelihoods calculated

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \rho \cdot \ln(\mu(i)))$
 Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-135.267662	7	284.535325
A2	-115.688533	12	255.377067
A3	-121.151707	8	258.303413
fitted	-162.090242	6	336.180484
R	-162.090242	2	328.180484

Explanation of Tests

Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)

Test 2: Are Variances Homogeneous? (A1 vs A2)

Test 3: Are variances adequately modeled? (A2 vs. A3)

Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)

(Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	92.8034	10	<.0001
Test 2	39.1583	5	<.0001
Test 3	10.9263	4	0.0274
Test 4	81.8771	2	<.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate

The p-value for Test 3 is less than .1. You may want to consider a different variance model

The p-value for Test 4 is less than .1. You may want to try a different model

The form of the response function by Model:
Model 2:  Y[dose] = a * exp{sign * b * dose}
Model 3:  Y[dose] = a * exp{sign * (b * dose)^d}
Model 4:  Y[dose] = a * [c-(c-1) * exp{-b * dose}]
Model 5:  Y[dose] = a * [c-(c-1) * exp{-(b * dose)^d}]
  
```

Note: Y[dose] is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally

This document is a draft for review purposes only and does not constitute Agency policy.

Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	9	0.327	0.189
3	10	0.852	0.6514
10	10	0.956	0.7368
22	10	0.792	0.4617
46	10	1.333	1.123
100	10	3.846	3.08

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	0.6166	0.4987	-1.742
3	0.651	0.5251	1.21
10	0.7391	0.5925	1.158
22	0.9186	0.7287	-0.5493
46	1.419	1.102	-0.2466
100	3.775	2.796	0.08069

Other models for which likelihoods are calculated:

Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$

This document is a draft for review purposes only and does not constitute Agency policy.

Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}\{e_{ij}\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$

Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e_{ij}\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-47.23498	7	108.47
A2	-8.679256	12	41.35851
A3	-8.980651	8	33.9613
R	-63.44829	2	130.8966
2	-19.6508	4	47.30161

Additive constant for all log-likelihoods = -54.22. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 4: Does Model 2 fit the data? (A3 vs. 2)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	109.5	10	< 0.0001
Test 2	77.11	5	< 0.0001
Test 3	0.6028	4	0.9628
Test 4	21.34	4	0.0002711

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is less than .1. Model 2 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 32.7092

BMDL = 26.1405

This document is a draft for review purposes only and does not constitute Agency policy.

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c-1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c-1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 6
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

47	1.032	0.6431	-0.7146
320	2.177	1.211	-0.2259
1024	2.256	1.248	0.758

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\mu(i))) * \rho$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}\{e(ij)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-9.701316	7	33.40263
A2	4.934967	12	14.13007
A3	2.296438	8	11.40712
R	-29.51921	2	63.03841
4	1.790563	5	6.418874

Additive constant for all log-likelihoods = -44.11. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 Test 3: Are variances adequately modeled? (A2 vs. A3)
 Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	68.91	10	< 0.0001
Test 2	29.27	5	< 0.0001
Test 3	5.277	4	0.26
Test 6a	1.012	3	0.7984

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 6a is greater than .1. Model 4 seems

Model Descriptions for likelihoods calculated

1
2
3 Model A1: $Y_{ij} = \mu(i) + e(ij)$
4 $\text{Var}\{e(ij)\} = \sigma^2$
5
6 Model A2: $Y_{ij} = \mu(i) + e(ij)$
7 $\text{Var}\{e(ij)\} = \sigma(i)^2$
8
9 Model A3: $Y_{ij} = \mu(i) + e(ij)$
10 $\text{Var}\{e(ij)\} = \exp(\ln \alpha + \rho \ln(\mu(i)))$
11 Model A3 uses any fixed variance parameters that
12 were specified by the user
13
14 Model R: $Y_i = \mu + e(i)$
15 $\text{Var}\{e(i)\} = \sigma^2$

16
17 Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-9.701316	7	33.402631
A2	4.934967	12	14.130066
A3	2.296438	8	11.407124
fitted	1.738274	6	8.523453
R	-29.519205	2	63.038411

26
27 Explanation of Tests

28
29 Test 1: Do responses and/or variances differ among Dose levels?
30 (A2 vs. R)
31 Test 2: Are Variances Homogeneous? (A1 vs A2)
32 Test 3: Are variances adequately modeled? (A2 vs. A3)
33 Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
34 (Note: When $\rho=0$ the results of Test 3 and Test 2 will be the same.)
35

36 Tests of Interest

Test	$-2 \cdot \log(\text{Likelihood Ratio})$	Test df	p-value
Test 1	68.9083	10	<.0001
Test 2	29.2726	5	<.0001
Test 3	5.27706	4	0.26
Test 4	1.11633	2	0.5723

45 The p-value for Test 1 is less than .05. There appears to be a
46 difference between response and/or variances among the dose levels
47 It seems appropriate to model the data
48

49 The p-value for Test 2 is less than .1. A non-homogeneous variance
50 model appears to be appropriate
51

52 The p-value for Test 3 is greater than .1. The modeled variance appears
53 to be appropriate here
54

55 The p-value for Test 4 is greater than .1. The model chosen seems
56 to adequately describe the data
57

Tbl2, T4 UGT

The form of the response function is:

$$Y[\text{dose}] = \text{control} + \text{slope} * \text{dose}^{\text{power}}$$

Dependent variable = Mean

Independent variable = Dose

The power is not restricted

The variance is to be modeled as $\text{Var}(i) = \exp(\text{lalpha} + \log(\text{mean}(i))) * \text{rho}$

Total number of dose groups = 6

Total number of records with missing values = 0

Maximum number of iterations = 250

Relative Function Convergence has been set to: 1e-008

Parameter Convergence has been set to: 1e-008

Default Initial Parameter Values

Model Descriptions for likelihoods calculated

- Model A1: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} \cdot \ln(\mu(i)))$
Model A3 uses any fixed variance parameters that were specified by the user
- Model R: $Y_i = \mu + e(i)$
 $\text{Var}\{e(i)\} = \sigma^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
-------	-----------------	-----------	-----

This document is a draft for review purposes only and does not constitute Agency policy.

A1	-9.701316	7	33.402631
A2	4.934967	12	14.130066
A3	2.296438	8	11.407124
fitted	-0.226526	5	10.453053
R	-29.519205	2	63.038411

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels?
(A2 vs. R)
 - Test 2: Are Variances Homogeneous? (A1 vs A2)
 - Test 3: Are variances adequately modeled? (A2 vs. A3)
 - Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
- (Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	68.9083	10	<.0001
Test 2	29.2726	5	<.0001
Test 3	5.27706	4	0.26
Test 4	5.04593	3	0.1685

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

Benchmark Dose Computation

Specified effect = 1
 Risk Type = Estimated standard deviations from the control mean
 Confidence level = 0.95
 BMD = 4.02257
 BMDL = 0.480637

Tbl2, UGT_1A1

The form of the response function by Model:

This document is a draft for review purposes only and does not constitute Agency policy.

Model 2: $Y[\text{dose}] = a * \exp(\text{sign} * b * \text{dose})$
 Model 3: $Y[\text{dose}] = a * \exp(\text{sign} * (b * \text{dose})^d)$
 Model 4: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-b * \text{dose})]$
 Model 5: $Y[\text{dose}] = a * [c - (c - 1) * \exp(-(b * \text{dose})^d)]$

Note: $Y[\text{dose}]$ is the median response for exposure = dose;
 sign = +1 for increasing trend in data;
 sign = -1 for decreasing trend.

Model 2 is nested within Models 3 and 4.
 Model 3 is nested within Model 5.
 Model 4 is nested within Model 5.

Dependent variable = Mean
 Independent variable = Dose
 Data are assumed to be distributed: normally
 Variance Model: $\exp(\ln\alpha + \rho * \ln(Y[\text{dose}]))$
 The variance is to be modeled as $\text{Var}(i) = \exp(\ln\alpha + \log(\text{mean}(i)) * \rho)$

Total number of dose groups = 5
 Total number of records with missing values = 0
 Maximum number of iterations = 250
 Relative Function Convergence has been set to: 1e-008
 Parameter Convergence has been set to: 1e-008

MLE solution provided: Exact

Table of Stats From Input Data

Dose	N	Obs Mean	Obs Std Dev
0	3	101	15.59
14	3	194	36.37
47	3	304	17.32
320	3	452	48.5
1024	3	296	149

Estimated Values of Interest

Dose	Est Mean	Est Std	Scaled Residual
0	101.9	11.6	-0.1288

This document is a draft for review purposes only and does not constitute Agency policy.

14	187.4	31.32	0.3668
47	300.4	67.58	0.09183
320	385.3	101.4	1.139
1024	385.4	101.4	-1.527

Other models for which likelihoods are calculated:

- Model A1: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \sigma^2$
- Model A2: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \sigma(i)^2$
- Model A3: $Y_{ij} = \mu(i) + e_{ij}$
 $\text{Var}(e_{ij}) = \exp(\lambda\alpha + \log(\text{mean}(i)) * \rho)$
- Model R: $Y_{ij} = \mu + e(i)$
 $\text{Var}(e_{ij}) = \sigma^2$

Likelihoods of Interest			
Model	Log(likelihood)	DF	AIC
A1	-68.74833	6	149.4967
A2	-58.69126	10	137.3825
A3	-64.89907	7	143.7981
R	-80.72265	2	165.4453
4	-65.54073	5	141.0815

Additive constant for all log-likelihoods = -13.78. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
 Test 2: Are Variances Homogeneous? (A2 vs. A1)
 Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 6a: Does Model 4 fit the data? (A3 vs 4)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	44.06	8	< 0.0001
Test 2	20.11	4	0.0004741
Test 3	12.42	3	0.006087
Test 6a	1.283	2	0.5264

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 6a is greater than .1. Model 4 seems to adequately describe the data.

This document is a draft for review purposes only and does not constitute Agency policy.

5 Other models for which likelihoods are calculated:
6

7 Model A1: $Y_{ij} = \mu(i) + e(ij)$
8 $\text{Var}\{e(ij)\} = \sigma^2$
9

10 Model A2: $Y_{ij} = \mu(i) + e(ij)$
11 $\text{Var}\{e(ij)\} = \sigma(i)^2$
12

13 Model A3: $Y_{ij} = \mu(i) + e(ij)$
14 $\text{Var}\{e(ij)\} = \exp(\alpha + \log(\text{mean}(i)) * \rho)$
15

16 Model R: $Y_{ij} = \mu + e(i)$
17 $\text{Var}\{e(ij)\} = \sigma^2$
18
19

20 Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-68.74833	6	149.4967
A2	-58.69126	10	137.3825
A3	-64.89907	7	143.7981
R	-80.72265	2	165.4453
5	-65.54073	5	141.0815

21
22 Additive constant for all log-likelihoods = -13.78. This constant added to the
23 above values gives the log-likelihood including the term that does not
24 depend on the model parameters.
25
26
27
28
29

30 Explanation of Tests

31 Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)

32 Test 2: Are Variances Homogeneous? (A2 vs. A1)

33 Test 3: Are variances adequately modeled? (A2 vs. A3)

34 Test 7a: Does Model 5 fit the data? (A3 vs 5)
35
36
37

38 Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	44.06	8	< 0.0001
Test 2	20.11	4	0.0004741
Test 3	12.42	3	0.006087
Test 7a	1.283	2	0.5264

39 The p-value for Test 1 is less than .05. There appears to be a
40 difference between response and/or variances among the dose
41 levels, it seems appropriate to model the data.
42

43 The p-value for Test 2 is less than .1. A non-homogeneous
44 variance model appears to be appropriate.
45

46 The p-value for Test 3 is less than .1. You may want to
47 consider a different variance model.
48

49 The p-value for Test 7a is greater than .1. Model 5 seems
50 to adequately describe the data.

$$\text{Var}\{e(ij)\} = \text{Sigma}(i)^2$$

Model A3: $Y_{ij} = \text{Mu}(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \text{rho} * \ln(\text{Mu}(i)))$
Model A3 uses any fixed variance parameters that were specified by the user

Model R: $Y_i = \text{Mu} + e(i)$
 $\text{Var}\{e(i)\} = \text{Sigma}^2$

Likelihoods of Interest

Model	Log(likelihood)	# Param's	AIC
A1	-68.748326	6	149.496653
A2	-58.691256	10	137.382511
A3	-64.899072	7	143.798144
fitted	-65.554216	6	143.108432
R	-80.722651	2	165.445302

Explanation of Tests

- Test 1: Do responses and/or variances differ among Dose levels? (A2 vs. R)
Test 2: Are Variances Homogeneous? (A1 vs A2)
Test 3: Are variances adequately modeled? (A2 vs. A3)
Test 4: Does the Model for the Mean Fit? (A3 vs. fitted)
(Note: When rho=0 the results of Test 3 and Test 2 will be the same.)

Tests of Interest

Test	-2*log(Likelihood Ratio)	Test df	p-value
Test 1	44.0628	8	<.0001
Test 2	20.1141	4	0.0004741
Test 3	12.4156	3	0.006087
Test 4	1.31029	1	0.2523

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels. It seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is less than .1. You may want to consider a different variance model.

The p-value for Test 4 is greater than .1. The model chosen seems to adequately describe the data.

$$\text{Var}\{e(ij)\} = \text{Sigma}(i)^2$$

Model A3: $Y_{ij} = \text{Mu}(i) + e(ij)$
 $\text{Var}\{e(ij)\} = \exp(\text{lalpha} + \log(\text{mean}(i)) * \text{rho})$

Model R: $Y_{ij} = \text{Mu} + e(i)$
 $\text{Var}\{e(ij)\} = \text{Sigma}^2$

Likelihoods of Interest

Model	Log(likelihood)	DF	AIC
A1	-572.4744	8	1160.949
A2	-290.7965	14	609.5929
A3	-293.806	9	605.6119
R	-603.6646	2	1211.329
5	-311.6633	6	635.3266

Additive constant for all log-likelihoods = -55.14. This constant added to the above values gives the log-likelihood including the term that does not depend on the model parameters.

Explanation of Tests

- Test 1: Does response and/or variances differ among Dose levels? (A2 vs. R)
- Test 2: Are Variances Homogeneous? (A2 vs. A1)
- Test 3: Are variances adequately modeled? (A2 vs. A3)
- Test 7a: Does Model 5 fit the data? (A3 vs 5)

Tests of Interest

Test	-2*log(Likelihood Ratio)	D. F.	p-value
Test 1	625.7	12	< 0.0001
Test 2	563.4	6	< 0.0001
Test 3	6.019	5	0.3044
Test 7a	35.71	3	< 0.0001

The p-value for Test 1 is less than .05. There appears to be a difference between response and/or variances among the dose levels, it seems appropriate to model the data.

The p-value for Test 2 is less than .1. A non-homogeneous variance model appears to be appropriate.

The p-value for Test 3 is greater than .1. The modeled variance appears to be appropriate here.

The p-value for Test 7a is less than .1. Model 5 may not adequately describe the data; you may want to consider another model.

Benchmark Dose Computations:

Specified Effect = 1.000000

Risk Type = Estimated standard deviations from control

Confidence Level = 0.950000

BMD = 15.1574

BMDL = 10.4625
