Definition: The Convention on Climate Change sets an overall framework for intergovernmental efforts to tackle the challenge posed by climate change. It recognizes that the climate system is a shared resource whose stability can be affected by industrial and other emissions of carbon dioxide and other greenhouse gases. The Convention enjoys near universal membership, with 189 countries having ratified. Under the Convention, governments: (1) gather and share information on greenhouse gas emissions, national policies and best practices. (2) launch national strategies for addressing greenhouse gas emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries. (3) cooperate in preparing for adaptation to the impacts of climate change. The Convention entered into force on 21 March 1994.

Abrupt Climate Change

**EPA EV-Environmental** 

Taxonomy

**Events-Climate Change** 

Definition 1: A shift in climate (e.g., temperature or precipitation) that occurs faster than the rate of change in the mechanism causing the change. The shift between glacial and interglacial stages, the shift between warm and cool periods during the last glacial time (Dansgaard-Oeschger cycles), and the Arctic oscillation are all considered abrupt climate changes. The shift in climate can occur over months to thousands of years and can occur in the absence of any known external cause. [NOAA Climate Program Office Glossary]

Definition 2: Sudden (on the order of decades), large changes in some major component of the climate system, with rapid, widespread effects.[Glossary of Climate Change Terms]

Climate Change

EPA EV-Environmental Taxonomy

**Events-Climate Change** 

Definition 1: A significant change from one climatic condition to another.

Definition 2: Climate change refers to any substantial change in measures of climate (such as temperature or precipitation) lasting for an extended period (decades or longer). Climate change may result from natural factors and processes or from human activities.

[Report on the Environment (ROE) Glossary]

Definition 3: Climate change refers to any significant change in the measures of climate lasting for an extended period of time. In

the components of the climate system. [NOAA Climate Program Office Glossary]

Definition 2: Changes in the global environment that may alter the capacity of the Earth to sustain life. Global change encompasses climate change, but it also includes other critical drivers of environmental change that may interact with climate change, such as land use change, the alteration of the water cycle, changes in biogeochemical cycles, and biodiversity loss.
